

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## PEASANT PROPRIETORS;

WITH

THE OUTLINES OF A PLAN FOR THEIR ESTABLISHMENT  
IN IRELAND.

BY

WILLIAM THOMAS THORNTON,

AUTHOR OF "OVER-POPULATION AND ITS REMEDY."

*Modum agri imprimis servandum.*

PLINII NAT. HIST., Lib. xviii.—7.

The lands of a country cannot be properly distributed, nor its agricultural economy be of the most improved description, unless it contain a due admixture of small, and of moderate-sized, as well as of large farms.

MACCULLOCH ON SUCCESSION TO PROPERTY.

LONDON :

JOHN MURRAY, ALBEMARLE STREET.

1848.

LONDON:  
BRADBURY AND EVANS, PRINTERS, WHITEFRIARS.

## PREFACE.

---

SUCH a work as this, if published a few years ago, might have been expected to attract but little notice. The question of which it treats was then somewhat prematurely regarded as finally settled, and an attempt to revive it, if not resented as an impertinent intrusion on public attention, would probably have been received with that scornful indifference with which antiquarian dissertations are commonly received by the busier portion of mankind. Small farmers and small proprietors had been summarily condemned, and having been condemned unheard, the sentence passed upon them was on that very account the less likely to be reversed, inasmuch as no opportunity had been afforded for the state-

ment of anything in their favour. To have appealed against a decision which had obtained such general acquiescence, would have been almost hopeless.

There is, however, in Truth an inherent force, which is sure to prevail in the end against every obstacle. Its light may long burn dimly, but it is never totally extinguished ; and, when least heeded, is slowly gaining strength to disperse the mists of error and prejudice in which it is enveloped. Even when public opinion was most decidedly in favour of large farms, and when their progress in this country was hailed as matter for national exultation, there were still a few who doubted whether the change that was taking place was productive of unmixed good, and whether the good which had obviously resulted from it, might not have been secured by other means, without so much social disturbance. The doubts of these sceptics were confirmed by further experience and more extended observation, and only timidly hinted at first, began by degrees to be expressed more distinctly and with more and more confidence. At length the avowed dissenters from the established creed became

numerous enough to constitute a sect. No person, perhaps, is better entitled to be styled its founder than that shrewd annotator on men and things, Mr. Laing, the well-known traveller. Mr. Blacker and Mr. Poulett Scrope also did good service in propagating its doctrines ; but its greatest accession of strength was received more recently, when it was joined by a powerful section of the "fourth estate," the conductors of the *Morning Chronicle*, and by one whose name must ensure respect for any cause which has the advantage of his support—Mr. John Stuart Mill—assuredly, whether as a dialectician, or as a political economist, without any living superior.

The example of such distinguished adherents has had its due effect, and the opinion maintained by them is visibly gaining ground. Its success, however, though sufficient to warrant sanguine hopes of its ultimate triumph, has hitherto been impeded by the prevailing ignorance with respect to the principles on which it rests. Each of the writers mentioned has done his part for the vindication of peasant proprietors ; but the task has been under-

taken systematically by none except the last, and even he, having been able to allot to it only a portion of a work embracing a variety of other topics, has not treated this one at the length which its importance deserves. It has, therefore, been thought that a distinct treatise on the subject, in which the arguments on both sides should be fairly confronted, and in which no mere speculations, however ingenious, should be permitted to pass without being submitted to the test of experience, might now prove neither useless nor unacceptable to a large and increasing class of readers. It might help to guide them to a decision on a question which, wherever human subsistence is derived from the soil, and in every community of which husbandmen form a considerable part, must be of immense importance ; but which possesses a ten-fold interest at this moment, and in this country, and which must be satisfactorily solved before any well-founded hope can be entertained of extrication from our present embarrassment.

With this view the following pages have been written. They are called a "Plea," and the title

confesses them to be the work of an advocate,—of one whose mind is made up, and who is anxious to bring others to his own way of thinking. Advocacy, however, when the result of honest conviction, is perfectly compatible with impartiality. The author has, of course, done his best to answer every argument opposed to his own views, but contending for truth alone, he has not been satisfied with the semblance of victory, nor condescended to disguise his weakness by misrepresenting what he could not refute. On the contrary, he has been careful to state both sides of the question with equal fairness, so that the reader whom he failed to convince might at least be furnished with ample materials for forming his own unbiassed judgment.

He thinks it due to himself to add, that the scheme proposed in the last chapter for the reclamation of the Irish waste lands is his own. Suggestions of a somewhat similar character have been made by Mr. Blacker and Mr. Scrope, but the outlines of the present author's plan were traced in a work published by him more than two years ago, when, so far as he is aware, Mr. Scrope had not

alluded to the subject either in or out of parliament, and before Mr. Blacker's Essays, although published much earlier, had been seen or heard of by him.

He mentions this with no desire of claiming originality which belongs more justly to another, but solely with the view of protecting himself against a charge of plagiarism of which he is wholly guiltless.

CHAPTER I.

COMPARATIVE PRODUCTIVENESS OF LARGE AND  
SMALL FARMS.

EVER since political economy was raised by Adam Smith to the dignity of a science, its British professors have been almost unanimously of opinion that small farms are incompatible with the prosperity either of agriculture or of agricultural labourers. Land, they assert, cannot be properly cultivated unless it be held in large quantities by men of capital, nor can its cultivators be in a satisfactory condition unless they be hired servants, and chiefly dependent for subsistence on the wages they receive. The eminent men by whom this notion has been promulgated have supported it by many ingenious and plausible arguments; nor has their advocacy

been confined to theoretical reasoning. They have ventured to appeal to experience and observation, and have been able to point to several facts, which at first sight, and until carefully examined, seem to justify their views. So long, indeed, as their attention was confined to their own country, the conclusion at which they arrived was just such as might have been expected. Sixty or seventy years ago, when their doctrine was coming into fashion, farms of 1000 or 1500 acres, though much less numerous than at present, were already not unknown in England; and though a more usual size was a hundred acres or thereabouts, farms of less than that extent were gradually becoming less common, and the cottage tenements of one acre and upwards had almost entirely disappeared. Simultaneously with this change in the arrangement of land, agriculture had made undeniable progress, and its improvement was most remarkable on the larger farms. With respect to farm labourers who had lost the land anciently attached to their habitations, they were not so well fed, or so expensively clad, as some centuries earlier, when sumptuary laws had been thought necessary to restrain their excesses in diet and dress; but the memory of those golden days was retained by few except professed antiquarians, and the result of a comparison with more recent times might have appeared favourable to the actual state of things.

During the reign of George II. and the first thirty years of George III., the English peasant was in a better position in many respects than in the preceding century. His wages were higher, though provisions and most other articles of consumption were cheaper. His supply of necessaries, if not plentiful, was at least not scanty, and the progress of the arts had placed many conveniences and luxuries within his reach, which were utterly unknown to his wealthier ancestors. With glass in his windows, a glass tumbler or two, and some plates and dishes on his shelves, and some potatoes, and possibly a little tea and sugar in his closet, it would have seemed ridiculous to question his advantage over his rude forefathers, whose horn casements excluded the light and admitted the wind, who ate and drank out of wooden bowls and bickers, and ate and drank little but what their own ground furnished. His superiority over the serfs of Germany and Russia, who, like his own ancestors, were paid for labour, not in money, but in land, was, of course, taken for granted. To have questioned it would have been a reflection on British freedom. It was therefore assumed, that the actual social position of the English agricultural labourer was the highest which he had ever attained; and it was further assumed, that the occupation of land by the lower class of peasants was a mark or relic of serfdom and

barbarism, and that their deprivation of land and conversion into labourers for money-wages, was an indispensable step in their progress to freedom and civilisation. Adam Smith himself, who appears to have subsequently taken a juster view of the subject, speaks in one of the early chapters of his great work, of "the diminution of the number of cottagers and other small occupiers of land," as "an event which has, in every part of Europe, been the immediate forerunner of improvement and better cultivation."

These inferences from observation of large farms in England, were shortly afterwards confirmed by the results of the formation of small farms in Ireland. The partition of the immense pastures by which so large a portion of that island had been overspread, was followed by the creation of a body of small farmers, poor, ignorant, and unenterprising at first, and poorer and more spiritless in every succeeding generation, and by the excessive multiplication of a cottar peasantry, whose debasement and misery are at once the wonder and the scandal of the age. Some explanation will hereafter be offered of the peculiar circumstances which caused the partition of farms to be followed in this instance by such deplorable consequences. It is sufficient in this place to admit the fact, and to acknowledge that it affords some justification for the opinion which has been founded upon it. With small farms, sloth and misery on one

side of St. George's Channel, and on the other large farms, tolerably cultivated and moderately productive, together with a peasantry in a condition which, by comparison, might almost be styled comfortable, even careful inquirers might be excused for concluding, that the several phenomena in juxtaposition bore to each other the relation of cause and effect. Whether this conclusion was correct as well as pardonable, or whether such hasty generalisation was quite consistent with the rules of induction, are questions which may be better answered when we come to extend our field of observation, and having collected additional facts, shall have ascertained how far they can be reconciled with the theory at present in vogue.

But how narrow soever may be the basis on which that theory rests, the superstructure itself must be confessed to be very cleverly put together, and to present a very imposing aspect. Nothing indeed could be more satisfactory than the way in which the superiority of large to small farms has been accounted for, provided only that the superiority were real, and that the advantages claimed for the former, and the evils imputed to the latter, actually existed. The arguments used have not only been very generally received among persons who have had no means of testing them: they have prejudiced the minds of many against the admission of opposite evidence, and

have stood their ground in situations where everything around bore testimony against them. Their fallacy can scarcely therefore be exposed without a patient and minute investigation ; and it is hoped that the space here allotted to that purpose will not be thought excessive, when the difficulty as well as the importance of the subject is considered.

It is asserted in the first place that small farms must needs be badly cultivated. "The produce of a farm of five, ten, or twenty acres, may perhaps enable its occupier to preserve his family from downright starvation ; but it will never," we are told, "enable him to accumulate stock to any extent." He must consequently be too poor to bear the expense of properly manuring, draining, or irrigating his fields ; he cannot afford to "use any but the simplest machines," nor to avail himself, except very insufficiently, "of the powers of the lower animals," nor of those improvements which in rich and enlightened countries are continually being made in his art. Neither can he properly vary his crops, but for want of space for judicious alternation must injure his land by making it bear similar sorts of produce too frequently. Moreover, not only is he mainly dependent on manual labour, with little aid from mechanism or from the inferior animals, he cannot even make the best use of that labour. The same man must by turns apply to every sort of work, and consequently

will do every job worse than it would be done on a large farm, where separate persons, it is said, would be "ploughmen, thrashers, hedgers, shepherds, cowherds, oxherds, limeburners, drainers, &c." Finally, the small farmer is seduced into idle habits by temptations too strong for his virtue, or forced into them by influences beyond his control. Not being subject to the same compulsion as the hired labourer, he "naturally" allows himself more frequent intervals of relaxation. "A cottager, however small his possession, has some species of produce to dispose of. This," it seems, "leads to a habit of going to market, where much precious time is lost in the adjustment of trifling bargains." "Nothing," as Mr. Young has very justly, but somewhat needlessly, remarked, "can be more absurd than a strong hearty man walking some miles, and losing a day's work in order to sell a dozen of eggs, or a chicken, the value of which would not be equal to the labour of conveying it if he were properly employed." Then it is assumed that farms cannot be small without being too small to afford constant employment to their occupiers. But the latter, when they have nothing to do at home, cannot find work elsewhere, at least, if all the neighbouring farms be of much the same size. In consequence, they contract habits of indolence which are too frequently converted ere long into habits of dissipation. Of course an idle drunkard, who

keeps neither a horse nor a cow, whose only tools are the spade and hoe, who seldom manures, and never drains, but nevertheless overcrops his land, is a wretched farmer, and it would be perfectly marvellous if his farm were not the counterpart of himself.\*

Here is a tolerably long list of charges, yet they form but one clause in the bill of indictment. Let us examine them separately, beginning with the culprit's alleged inevitable indigence.

From a comparison of the number of persons engaged in agriculture, with the supposed extent of cultivated land, it appears that one such person is employed on every twenty-four acres of such land in England and Wales. Twenty-four acres (even though, according to the proportion usual in England, only two-fifths of that quantity be under tillage, and the remainder pasture) are probably more than can be cultivated in the most efficient manner by a single person, whether he be a hired servant, or a small farmer†; but of the two, the latter, provided he be a leaseholder on reasonable terms, and not a rackrented tenant at will, is pretty certain to obtain the largest

\* *Encyclopædia Britannica*, Art. Cottage System.

† An explanation of the mode in which one man, unassisted except by his wife and children, and using the spade instead of the plough, can keep as many as six acres under the most perfect and garden-like tillage, is given in the treatise on Flemish Husbandry (p. 75), published in the Library of Useful Knowledge.

amount of produce. He may perhaps set about his work less systematically; he may not command the same means of economising labour, but, nevertheless, from some cause or other, his labour is pretty sure to be more abundantly rewarded; his land generally bears by far the heaviest crops. In the year 1837, the average yield of wheat in the large farms of England was only twenty-one bushels, and the highest average for any one county was no more than twenty-six bushels.\* The highest average since claimed for the whole of England is thirty bushels, and, according to a statement resting on the same authority, the

\* See Table in Macculloch's *Statistics of British Empire*, vol. i. p. 482. In Mr. Macculloch's latest work on *Succession to Property*, p. 117, the average produce of wheat in England and Wales is said to be "certainly not under thirty bushels" per acre; but no authority is given for this statement, whereas that for 1837 was founded upon separate returns for every county. It is evidently impossible that such extraordinary progress can really have been made in so short a time, and there can be little doubt that the average of a few greatly improved districts is represented as that of the whole kingdom. Great improvement has certainly been made of late years, but not so much as to invalidate the comparisons drawn in the text; for agriculture, while advancing in England, has not been stationary in other countries. In Guernsey, in 1835, four quarters per acre were considered a good crop of wheat; but at the last meeting of the Guernsey Agricultural Society, the largest yield of white wheat was reported to have been not less than nine imperial quarters per acre, and that of red wheat seven quarters and a half. These crops would be thought so prodigious in England that I at first suspected the account to be exaggerated. Its accuracy is, however, attested by a gentleman who is not likely to be mistaken, Mr. Le Beir, the able secretary of the Guernsey Agricultural Society. His letter on the subject will be found in the Appendix.

produce of the seed is "seldom less than twelve-fold, but if drilled, fourteen-fold, and if dibbled, sixteen, or even twenty-fold."\* In Jersey, where the average size of farms is only sixteen acres, the average produce of wheat per acre was stated by Inglis,† in 1834, to be thirty-six bushels; but it is proved by official tables to have been forty bushels in the five years ending with 1833.‡ In Guernsey, where farms are still smaller, four quarters per acre, according to Inglis, "is considered a good, but still a very common crop." In Flanders, where the most numerous class of farms consists of those between five and ten acres, the average yield of wheat is at least thirty bushels.§ Mr. Macculloch, indeed, without quoting his authority, sets it down at no more than twenty bushels and a-half per acre; but this, though only a trifle below the average ascribed by the same writer to the whole of England, and higher than that of one-half of the whole number of English counties, is evidently incorrectly stated, and must be considerably below the truth, as Mr. Macculloch likewise says, that the seed sown produces more than twenty-fold.|| It should be

|| Geog. Dict., vol. i. pp. 331-2.

observed that the soil, both of Flanders and of the Channel Islands, is, for the most part, of a light sandy character, ill adapted for the growth of wheat. Of barley, a more suitable crop, the quantity in some parts of Belgium is sometimes as much as eighty bushels per acre, and the average is forty-five; while in England it is only thirty-three bushels.\* Of potatoes, the average produce in England is certainly not more than 300 bushels, or 22,200 lbs. per acre, and is probably not nearly so much. In Belgium it is ten tons, or 22,400 lbs.,† and in Jersey 35,000 lbs.‡ Clover, another most important article of farm produce, is nowhere found in "such perfect luxuriance" as in Flanders, where it exhibits "a vigour and weight of produce truly surprising," more especially when it is considered "that such prodigious crops are raised from six pounds of seed per acre." § These proofs may be thought sufficient to establish the superior productiveness of small farms; but if others be required, they may be found in England itself, among the smallest of small farmers, the allotment-holders of a quarter of an acre, who seldom fail to obtain a profit of at least five pounds sterling even from that morsel of ground. It appears then that the small

§ Macculloch, *ut supra*, p. 331.

occupier, in spite of his disabilities, real or imaginary, would be able to get a good deal more from his land than it would yield if it formed a portion of a large farm. After paying, therefore, rent at the same rate as the large farmer, and after taking for his own use the same sum as would be applied to the maintenance of the cultivator of an equal portion of a large farm, he would have remaining, not only as great, but a much greater relative surplus wherewith to continue his cultivation. Acre for acre he would be able to spend in improvements, not only as much, but a good deal more than his rival. The whole of his profits would not indeed enable him to do some few things which are occasionally done by managers of large properties. Assuredly he could not, "to improve the breed of his sheep, give a thousand guineas for the hire of a single ram, for a single season," nor "send across the kingdom to distant provinces for new implements, and for men to use them," nor "employ and pay men for residing in provinces where practices were found which he might wish to introduce." But with all deference to Arthur Young, who says that such efforts are common in England, they neither are nor need be made, except very rarely, and by very few even of large farmers, and all the ordinary expenses of cultivation the small farmer is equally able to bear. With as much ease as the tenant of two or three square miles he can afford, if need be,

“to cover his whole farm with marl at the rate of 100 or 150 tons per acre,”—“to drain all his land at the expense of two or three pounds per acre,”—“to pay a heavy price for the manure of towns, and convey it thirty miles by land carriage,” or “to float his meadows at the expense of five pounds per acre.” What reason is there for doubting his ability to do this? The original capital, whether of a great or of a small farmer, must, in fairness, be assumed to bear an equal proportion to the extent of the farm; its only certain source of increase is the profits of farming, and the small farmer’s profits have been shown to be the greatest. In proportion to the size of his farm, therefore, he must have not merely as much, but a good deal more money to spend on cultivation.

In effect, his expenditure is often proportionably the greater of the two. The richest English farmers are less prodigal of manure than those of Belgium, who, by the continual intermixture of animal and vegetable refuse, have converted a sterile sand into a dark rich loam of unsurpassed fertility. In the Channel Islands, also, manure is employed with almost equal liberality, ten cart-loads of sea-weed worth fifty shillings, besides stable dung, being the allowance for an acre.\* Drainage is an operation which, in many situations, cannot be effectually

\* Duncan’s History of Guernsey, p. 294.

executed, unless it be undertaken on an extensive scale; but that the necessity of combining for the purpose does not prevent small occupiers from properly performing this important part of their business is shown by the example of the Netherlands, the country, above all others, in which drainage is most indispensable, and in which also it is best provided for. Combination equally enables small farmers to construct expensive works for irrigation. Perhaps the most ingenious contrivances of the kind which anywhere exist, are to be found, not among the scientific and wealthy agriculturists of Europe, but among the Bedouins of some Arabian oases, which owe their fertility to the labour and skill exerted by the inhabitants in order to obtain supplies of water. The greater part of the country being destitute of running streams on the surface, springs are sought in high places beneath it, and in order to reach them, the ground must often be opened to a depth of forty feet. "A channel from the fountain head is then, with a very slight descent, bored in the direction to which it is to be conveyed, with apertures at regular distances, to afford light and air, to those who are occasionally sent to keep it clean. In this manner water is frequently conducted from a distance of six or eight miles, and an unlimited supply is obtained. The channels are usually about four feet broad and two feet deep, and

contain a clear rapid stream.”\* If the small farmer use only the “simplest machines,” it is probably because experience has taught him, as we shall hereafter see, that the simplest tools are by far the most efficient. If he keep no horses, it is commonly because he seldom has occasion for them, and that it is cheaper for him to hire them when necessary; and with respect to his alleged inability to avail himself of the services of others of the “lower animals,” it is sufficient to remark that the live stock of a Belgian farmer of no more than six acres, commonly consists of two cows, a calf or two, one or two pigs, a goat or two, and some poultry.”† Such a farmer in Belgium would use the spade only for trenching the ground; but among equally small occupiers in the Channel Islands, whether from attachment to old customs, or from some other cause, not only is the plough in general use, but a plough called “la grande querrue,” so large and lumbering, that not less than eight or ten horses or oxen are often employed to draw it. Very few of the peasants are rich enough to possess one of these ponderous engines, or the number of cattle required for it; but

\* Wellsted's Travels, vol. i. p. 93.

† Mr. Nicholls' Report on Holland and Belgium. “It would startle an English farmer of four hundred acres of arable land, if he were told that he should constantly feed one hundred head of cattle; yet this would not be too great a proportion if the Flemish system were strictly followed.”—*Flemish Husbandry*, p. 94.

the poorest has no difficulty in borrowing both the one and other from his neighbours, who, moreover, cheerfully assist each other in busy seasons. The good feeling subsisting between the people of the Channel Islands, allows this exchange of services to be effected by barter; but even if money were employed in the transaction, it is obvious that every one, with the hire of his own services, would be able to purchase an equal quantity of work from others, and that thus the division of labour could be practised even on small farms, although not nearly to the extent to which it is carried on in large ones. So much must be admitted in favour of the latter; but of all the claims hitherto enumerated, set up on their behalf, this is the only one which can be even partially conceded. There is certainly not the least foundation for the assertion that a suitable rotation of crops is impracticable in small farms. Every owner of a few perches of garden ground has room enough to prevent his beds of cabbage, peas, beans, and lettuces, from repeatedly occupying the same sites, and until some reason to the contrary be shown, the tenant of five or six acres must be supposed capable of taking a similar precaution with respect to his crops of grain and roots.

But of all the charges brought against small farmers, the one for which there is least pretence is that which represents them as slothful; for it is

not only not true—it is the very reverse of the truth. Small farmers (or rather such of them as are either owners or leaseholders of their farms, and it must be distinctly understood that this vindication is intended to apply to no others) are not only not generally indolent, but their most distinguishing characteristic is ardent, constant, nay, almost excessive industry. Circumstances may no doubt be imagined in which it would be impossible for them to be uninterruptedly employed. If in any district all the farms were of the same size, and if that size were insufficient to occupy the entire labour of one man, the occupiers would sometimes be without work at home, and would be unable to procure it elsewhere. But why heap up such hypothetical difficulties? As the warmest admirer of large farms will not deny that they may nevertheless be too large, and that it would be undesirable to parcel out the whole of Great Britain after the fashion adopted with such extraordinary effects in the county of Sutherland, so, on the other hand, it may be admitted that it is possible for farms to be too small. When small farms are defended, it is of course understood, either that the smallest is sufficiently large to keep its tenant in full work, or that if any are below that size, a proportionate number are above it. Unless, therefore, it be supposed that small farms have a tendency to decrease in size (a

point to which we shall come hereafter), the apprehension that small farmers must necessarily be occasionally idle from absolute deficiency of work, may be dismissed as altogether illusory. It is further asserted, however, that the small farmer, even when he has work to do, will be apt to shirk it. He is subject to no immediate compulsion. No one can forbid his sitting down as soon as he is tired, or taking a holiday whenever he feels inclined; and it is presumed that he will not fail to abuse this liberty. But although he is exempt from the same compulsion, he is stimulated to exertion by influences much stronger than any that affect the hired labourer. The latter must not indeed openly dawdle about his business, or he may be dismissed; but provided he work hard enough to content his master, he is himself content, and aims at nothing more. He has little or no inducement to exert himself further; he has no certainty of gaining an increase of wages by so doing: it is far more probable that virtue in his case would be suffered to be her own sole reward; and industry is a virtue united too closely with fatigue to allow of such a reward being very eagerly coveted. On the contrary, leaseholding cottage-farmers work for themselves; their remuneration is regulated by their exertions; the fruits of their industry, after a certain fixed deduction has been made, belong to themselves, and the produce of any

extra labour is wholly their own. Day labourers never work so hard as when paid by the piece; but a cottage-farmer does nothing else but piece-work. Human nature would be even more inconsistent than it is commonly supposed, if a man would waste time, of so much value to himself, either in rest, recreation, or marketing; and yet would exert himself diligently as a day-labourer, in order to avoid dismissal from a situation not nearly so remunerative. In truth, the only instances of idleness on the part of cottage-farmers are taken from countries where they are only yearly tenants. But the reputation of rack-rented yearly cottars has already been acknowledged to be too rotten to be patched up, and must be abandoned to the mercy of their censors. The small farmers, with whom we are at present dealing, are such only as, being either leaseholders or proprietors, have a secure hold upon the land, and the industry of these is admitted even by their most determined opponents. Mr. Macculloch represents them as contracting "indolent habits," as being "incapable of continuous and vigorous exertion," and as not accumulating capital "in one case out of a hundred." Yet the same Mr. Macculloch confesses that "the very large produce obtained by the Flemish farmer is solely attributable to indefatigable industry, for that the soil is naturally poor and the climate by no means especially favour-

able;" and he adds, that "an industrious Fleming, with fifteen acres of good light land, brings up his family in decent independence, and in the course of his life accumulates sufficient means to put them in possession of a little farm of their own."\* Arthur Young, an equally zealous champion of large farms, who in the course of his tour through France could see nothing else "respectable" in small properties, yet admits that he found "a most unremitting industry." "Though," says he, "the husbandry I met with, in a great variety of instances, on little properties, was as bad as can well be conceived, yet the industry of the possessors was so conspicuous and meritorious, that no commendations would be too great for it."†

In order to accumulate evidence to the same effect, it is only necessary to turn to any country in which the peasantry cultivate their own lands. Such is the case in Zurich, as well as in several other Swiss Cantons; and, accordingly, says Inglis, "Anywhere in the neighbourhood of Zurich, in looking to the right or the left, one is struck with the extraordinary industry of the inhabitants. In the industry they show in the cultivation of the land, I may safely say they are unrivalled. When I used to open my case-

\* Compare Statist. Acct. of Brit. Emp., vol. i. pp. 150 and 151; and Geog. Dict., vol. i. p. 330.

† Travels in France, vol. i. p. 412.

ment between four and five in the morning to look out upon the lake and the distant Alps, I saw the labourer in the fields, and when I returned from an evening walk, long after sunset, as late perhaps as half-past eight, there was the labourer, mowing his grass or tying up his vines. But there are other and better evidences of the industry of the Zurichers than merely seeing them late and early at work. It is impossible to look at a field, a garden, a hedge, scarcely even a tree, a flower or a vegetable, without perceiving proofs of the extreme care and industry that are bestowed upon the cultivation of the soil. If, for example, a path leads through or by the side of a field of grain, the corn is not, as in England, permitted to hang over the path, exposed to be pulled or trodden down by every passer-by; it is everywhere bounded by a fence; stakes are placed at intervals of about a yard, and about two and four feet from the ground, boughs of trees are passed longitudinally along. If you look into a field towards evening, where there are large beds of cauliflower or cabbage, you will find that every single plant has been watered. In the gardens, which around Zurich are extremely large, the most punctilious care is evinced in every production that grows. The vegetables are planted with seemingly mathematical accuracy; not a single weed is to be seen, nor a single stone. Plants

are not earthed up as with us, but are placed in small hollows, into each of which a little manure is put, and each plant is watered daily. Where seeds are sown, the earth directly above is broken into the finest powder ; every shrub, every flower is tied to a stake ; and where there is wall fruit, a trellice is erected against the wall to which the boughs are fastened, and there is not a single twig that has not its appropriate resting-place.”\* In another place, he says, “When speaking of the Engadine,” (with respect to which he had previously stated that the whole of the land belongs to the peasantry,) “I did not sufficiently enlarge upon the industry of the inhabitants, but it deserves a panegyric. There is not a foot of waste land in the Engadine, the lowest part of which is not much lower than the top of Snowdon. Wherever grass will grow, there it is ; wherever a rock will bear a blade, verdure is seen upon it ; wherever rye will succeed, there it is cultivated. Barley and oats have also their appropriate spots ; and wherever it is possible to ripen a little patch of wheat, the cultivation of it is attempted.”† Mr. Laing confirms these statements, and applies the description to Switzerland generally. “The little spots of land,” he says, “show the same daily care in the fencing, digging,

\* Inglis's *Switzerland and South of France*, vol. i. pp. 32 and 33.

† *Ibid.* pp. 145 and 6.

weeding, and watering." The owners "have a kind of Robinson Crusoe industry about their houses and little properties; they are perpetually building, repairing, altering, or improving something about their tenements."\* In Germany, Mr. Howitt, after mentioning that the land "is for the most part in the hands of the people," and "parcelled out amongst the multitude," describes the peasantry as labouring "early and late, because they feel that they are labouring for themselves. There is not an hour of the year," he adds, "in which they do not find unceasing occupation. In the depth of winter, when the weather permits them by any means to get out of doors, they are always finding something to do. They carry out their manure to their lands while the frost is in them. If there is not frost, they are busy clearing ditches and felling old fruit-trees, or such as do not bear well. Such of them as are too poor to lay in a sufficient stock of wood, find plenty of work in ascending into the mountainous woods and bringing thence fuel. It would astonish the English common people to see the intense labour with which the Germans earn their firewood. In the depth of frost and snow, go into any of their hills and woods, and there you find them hacking up stumps, cutting off branches, and gathering, by all

\* Notes of a Traveller, pp. 354 and 355.

means which the official wood-police will allow, boughs, stakes, and pieces of wood, which they convey home with the most incredible toil and patience.”\* In another place he says, “In England, with its great quantity of grass lands, and its large farms, so soon as the grain is in, and the fields are shut up for hay grass, the country seems in a comparative state of rest and quiet. But here they are everywhere and for ever hoeing and mowing, planting and cutting, weeding and gathering. They have a succession of crops like a market-gardener. They have their carrots, poppies, hemp, flax, sainfoin, lucerne, rape, colewort, cabbage, rutabaga, black turnips, Swedish and white turnips, teasles, Jerusalem artichokes, mangel-wurzel, parsnips, kidney-beans, field beans and peas, vetches, Indian corn, buckwheat, madder for the manufacturer, potatoes, their great crop of tobacco, millet—all, or the greater part, under the family management in their own family allotments. They have had these things first to sow, many of them to transplant; to hoe, to weed, to clear of insects, to top, many of them to mow and gather in successive crops. They have their water meadows, of which kind almost all their meadows are, to flood, to mow, and to reflood; watercourses to reopen and to make anew; their early fruits to gather, to

\* Howitt's Rural and Domestic Life of Germany, p. 44.

bring to market with their green crops of vegetables: their cattle, sheep, calves, fowls, and poultry, to look after; their vines, as they shoot rampantly in the summer heat, to prune and thin out the leaves where they are too thick; and anyone may imagine what a scene of incessant labour it is."\* As Mr. Inglis had declared the industry of the small proprietors of Zurich to be "unrivalled," so Mr. Howitt calls the small proprietors of Germany, "the most industrious peasantry in the world," the truth being, as Mr. Mill aptly observes, in commenting on this remark of Mr. Howitt's, that "whoever is acquainted with only one region in which there are peasant proprietors, invariably thinks the peasantry of that particular region the most industrious in the world." Enough surely has now been said to prove that there is no vice with which small farmers are less justly chargeable than with idleness, and it cannot be necessary to produce other witnesses in their favour from the Channel Islands, the Tyrol, or from the Saxon colonies of Transylvania.

It appears, then, that the disabilities represented as inseparable from the condition of small farmers, have no real existence, and that there is really nothing to prevent persons of that class from practising the most approved methods of cultivation.

\* Howitt's *Rural and Domestic Life of Germany*, pp. 50, 51.

They are not necessarily poor, but on the contrary, as their rate of profit is higher, are likely to be relatively richer than large farmers; they can lay out more money on their land in proportion to its extent; they can use more manure; they can buy for themselves all ordinary agricultural implements; and, by combination among themselves, can obtain the use of the most costly machines, or effect the most expensive improvements; the idea of their being prevented by want of space from varying their crops, is merely fanciful; -and although they may be unable to carry the division of labour as far as might be desirable, their disadvantage in that, and all other respects, is much more than counterbalanced by the superiority of their industry. Still, it cannot be denied that small farmers do not, in general, avail themselves to the utmost of the means at their command. Living always on the same spot, with little taste or time for reading, they know little of what goes on beyond the bounds of their immediate neighbourhood; and, like all persons in similar circumstances, they are exceedingly averse to change, unduly attached to old habits and proportionately disdainful of foreign practices. The most skilful and successful of all small farmers, the Flemings, are, perhaps, as obnoxious as any to this reproach. None adhere more pertinaciously to hereditary usages, or are more unwilling to adopt modern inventions, or to

listen to the counsels of modern science. No fields can be more carefully tilled than theirs; nowhere is the ground more frequently turned up, more thoroughly drained or kept freer from weeds. But the implements of husbandry are, in general, rude and clumsy; the horses are oppressed by massy wooden collars, and broadcast sowing, in spite of the manifold objections to it, is still very commonly preferred to drilling. But is this prejudice in favour of antiquated absurdities a reason for the unqualified condemnation of small farmers? Does it not rather furnish the strongest possible proof that there must be some extraordinary excellence in a system which, in spite of such glaring defects, is more than a match for all the efforts of capital and science combined? The small farmer may be ignorant, may work with bad tools, and may not distribute his labour in the most economical manner; but with all his stupidity and awkwardness he nevertheless contrives to make his land yield more than a large occupier, with all his skill, could obtain from it. This has been already shown to be the case, and it is, indeed, so well known to all who have taken the trouble to inquire into the matter, that if the question at issue between large and small farms were to be determined by their respective amounts of gross produce, a verdict would infallibly be given in favour of the latter.

Gross produce is not, however, the only thing to

be considered, for, as Arthur Young remarks, so many hands might be employed to raise the largest amount, as to afford nothing for the market. In such a case there could be no towns, no exchange of raw produce for manufactures, no division of labour; all the members of the community would be husbandmen, and would raise or manufacture every article at home. Everything, although very badly made, would have cost a great deal of labour. No progress could be made in the arts of life; society would remain in its rudest stage, and, instead of the blessings of civilisation, there would be nothing but a sort of savage independence. For these reasons, Young pronounces that to be the best method of cultivation, which allows of the largest produce being carried to market; but neither is this test altogether unexceptionable. The largest surplus produce might be raised by cultivators who were not permitted to retain sufficient for their own wants, and it would certainly be desirable that their necessities should first be adequately supplied, even though somewhat less should remain for the consumption of others. That is the best system of agriculture, not which provides for one class at the expense of another, but which insures the largest amount of happiness to all. The cultivators of the earth are not as they are too often represented, little better than machines, whose business it is to raise food for the rest of mankind, and whose

consumption of part of what they themselves produce, is to be regretted as a national loss, a deduction from the sum of national wealth, and is, consequently, to be restricted as much as possible. Their office is not, no matter by means of what self-privation, to provide the largest possible surplus produce for other classes. They are themselves, not less than artisans and manufacturers, constituent parts of the community, and it is essential to national welfare that they equally with the others should be maintained in plenty and comfort. Unless a considerable share of agricultural produce be reserved for classes not agricultural, civilisation is impossible; but national well-being is equally impossible, if that share be excessively augmented at the expense of the cultivators. That is not the best system of agriculture which provides most abundantly for the former classes, unless it likewise provide adequately for the latter. Small farms might possibly be preferable to large ones, even though it should appear that a smaller surplus produce were sent from them to market.

Waiving, however, these considerations, and accepting unconditionally the test proposed by Young, we shall still find that small farms are not only the most productive in proportion to their extent, but that the supplies sent from them to market are also relatively the largest. This might, perhaps, at once be taken for granted, if the average size of small

farms were not below twenty-four acres—the extent of land which, as we have seen, affords complete occupation to one cultivator on the large farms of Great Britain. For, as the small farmer would obtain a much larger gross produce than the other cultivator, he might retain for his own use as much or more than would have been consumed by the latter, and yet have a greater quantity left for sale. But in countries in which small farms abound, their average size is frequently, perhaps generally, less than twenty-four acres: in France, it appears to be eighteen acres; in Jersey, sixteen; and in Guernsey, where land is more minutely divided than perhaps in any other part of Europe, is little more than eleven acres. Of course, the number of cultivators on land so divided must be greater than on an equal extent occupied by large farmers: in Guernsey, for example, the agricultural population is three times as dense as in England. But it is by no means so obvious as some writers imagine that, “where a great proportion of the inhabitants is directly supported by the produce of the soil, there must be less of it to support others.”\* Undoubtedly, if the gross produce be the same in both cases, more will remain when the subsistence of only one, instead of that of three cultivators, has been deducted. But if

\* Encyclopædia Britannica. Art. Cottage System.

the combined exertions of the three can augment the gross produce by a quantity sufficient for the consumption of two, the surplus remaining beyond their consumption will be precisely the same as if only one had been employed. Now, the consumption of the family of a cultivator in England may be estimated at about one-fifth of the produce of the portion of land cultivated by him—that being the numerical proportion borne by the agricultural class to the rest of the community. If, therefore, three cultivators can obtain from a piece of land crops exceeding by two-fifths those which a single person could raise, they will have precisely the same neat produce remaining after their own wants are satisfied, and will be able to send precisely the same quantity to market. Now, taking Mr. Macculloch as our authority as to the productiveness of English agriculture, (for Mr. Chadwick's higher estimate is certainly applicable only to a few of the most improved counties, and probably only to a few of the best managed farms,) we have twenty-one bushels of wheat as the average produce per acre. But in Guernsey the average wheat crop has never been stated at less than thirty-two bushels per acre; that is to say, considerably more than two-fifths above the English average. Thus, three persons may be employed in Guernsey on land, which in England would afford occupation only to one; and yet, after

feeding themselves with the fruits of their labour, will have not only as much, but a good deal more food remaining for other people, than would have been reserved by the English cultivator. In corroboration of this conclusion, it may be mentioned that a Flemish farmer of six acres of moderate land, obtains from two acres and a half, as much grain, potatoes, butter, pork, and milk, as are required for the consumption of himself, his wife, and three children, and sells the produce of the remaining three acres and a half.\*

One thing, which by itself might seem to prove that markets are better supplied by small than by large farms, is the fact that land, when divided among many occupiers, commonly pays a much higher rent than when united into one extensive holding. Thirty shillings an acre would be thought in England a very fair rent for middling land ; but in the Channel Islands, it is only very inferior land that would not let for at least 4*l.*, and in Switzerland the average rent seems to be 6*l.* per acre. Rent being that portion of the produce of land which remains after the expenses of cultivation are deducted, it is evident that small farms, as they pay the highest rent, must also yield the largest surplus produce. So much, at least, is incontestable ; but the portion of

\* Flemish Husbandry, p. 74.

produce remaining over and above what is reserved for the cultivators, is not all that is sent to market, for part of the share of the cultivators is also sold, in order to furnish them with the means of procuring the various articles they require in addition to food ; and it is certainly possible, though there is not the least reason for supposing it, that the cultivators of a large farm may sell a larger proportion of their shares than those of a small farm, and may compensate, by that means, for the deficiency of the portion which they appropriate for the payment of rent. We shall hereafter find, that there are no grounds whatever for this hypothesis, and that it is not only not true, but directly opposite to the truth ; still, although actually erroneous, it might by possibility be correct, and it must therefore be admitted, that payment of the highest rate of rent does not afford absolute proof, but merely very strong presumption, that small farms send likewise the most abundant supplies to market.

The same inference might be drawn from the fact that some of the countries in which land is most minutely divided, are also among those which maintain the largest manufacturing and commercial population. Belgium, for instance, is second in this respect to Great Britain alone ; and Switzerland, and the Rhenish provinces of Prussia, may also be cited as examples. It may indeed be objected, that non-

agricultural classes may not be entirely dependent for their subsistence on home produce, but may derive part of their supplies of food from abroad, and it may generally be impossible to discover what portion is imported. This objection, however, does not apply to the Channel Islands. We are there able to ascertain pretty accurately the quantities of food imported and exported, and after making the needful allowance on that account, we shall find that two small territories occupied exclusively by small farmers, and affording employment to two or three times the number of cultivators that would be thought requisite on large farms, do nevertheless furnish a sufficiency of food, not only for those cultivators and their families, but for a larger non-agricultural population in addition than is maintained by an equal extent of land, even in Great Britain, the model country of the eulogists of large farms.

The extent of cultivated land in Great Britain is estimated at nearly thirty-four millions of acres. The population in 1841 was 18,720,394 persons, of whom twenty-two per cent. belonged to the agricultural class. The class so denominated, however, included not only the persons actually engaged in agriculture, but likewise their families, the number of the former being only 1,480,880, or about one-twelfth of the population; so that the number who, in the largest sense of the word, might be termed non-agricultural,

was not less than 17,239,514. But these were not entirely dependent for subsistence on the produce of the British soil. The quantity of grain annually brought to market in the United Kingdom is estimated at thirty millions of quarters, of which, previously to the repeal of the Corn Laws, about two millions, or one-fifteenth, came from abroad. This statement, it will be observed, applies to the whole of the United Kingdom. Of the grain brought to market in Great Britain alone, between two and three millions of quarters, equal probably to one-tenth of the entire quantity, were annually brought from Ireland, so that supposing an equal proportion of other provisions to have been of transmarine production, one-sixth of the non-agricultural population may be considered to have been fed on imported provisions. The number of persons, exclusive of the cultivators, who subsisted on home produce, was between fourteen and fifteen millions, or one person to about every two acres and a half of cultivated land.

The proportion between the agricultural and other classes in the Channel Islands is not stated by the late Census Commissioners, but all the other particulars required for a comparison with Great Britain are procurable. Jersey contains 26,600 acres of cultivated land: her population in 1841 was 47,544; the number of persons engaged in agriculture 2392,

or one-nineteenth of the whole; and the non-agricultural population (using that term in the same extended sense as before) 45,152. In the year 1835 foreign provisions were imported to the value of about 80,000*l.*; but whereas corresponding imports into Great Britain are purchased almost entirely with manufactured goods, in the Channel Islands they are, to a large extent, bartered for other agricultural produce. The exports of provisions from Jersey in 1835 were worth nearly 60,000*l.*,\* so that the value of the net imports was little more than 20,000*l.*, which, even at the very low rate of 10*l.* a head, would suffice for the maintenance of only two thousand persons. Deduct this number from the non-agricultural population referred to above, and there will remain 43,152 persons over and above the cultivators to be fed with the produce of 26,600 acres. This is at the rate of four persons to every two acres and a half.

The results exhibited by Guernsey are still more striking. The cultivated portion of that island contains 10,240 acres; the total population in 1841 was 26,649; the number of cultivators 1,494, or rather less than one-eighteenth of the whole; and the non-agricultural residue 25,155. In the year 1834 foreign provisions were imported to the value of 81,400*l.*,\* but provisions were exported to the value of 27,500*l.*, so that the value of the net imports was 53,900*l.* This sum might suffice for the maintenance of

Martin's British Colonies, vol. v. pp. 481-2. I have taken those years both for Jersey and Guernsey, for which I had the fullest information. The quantities of butter are misstated by Martin. In the table above, they are given upon the authority of a paper obtained from the Guernsey Custom-house.

between five and six thousand persons, leaving nearly 20,000, besides cultivators, to be fed with the produce of 10,240 acres. This is at the rate of very nearly five persons for every two acres and a half.

Thus it appears, that in the two principal Channel Islands, the agricultural population is, in the one, twice, and in the other, three times, as dense as in Britain, there being in the latter country only one cultivator to twenty-two acres of cultivated land, while in Jersey there is one to eleven: and in Guernsey one to seven acres. Yet the agriculture of these islands maintains, besides cultivators, non-agricultural populations, respectively, four and five times as dense as that of Britain. This difference does not arise from any superiority of soil or climate possessed by the Channel Islands, for the former is naturally rather poor, and the latter is not better than in the southern counties of England. It is owing entirely to the assiduous care of the farmers and to the abundant use of manure. The results of the comparison just made may be surprising to most English readers, but the Channel Islanders themselves are not insensible of the advantages they derive from their method of farming, and very reasonably congratulate themselves upon it. "There are larger estates in England," says a late Bailiff of Guernsey, Mr. Brock, "than the whole of this island, but where will one be found that produces

the quantity of provisions sent to market by our small farms? Let the production of the island be compared to that of any ten thousand acres kept in one, two, or three hands in Great Britain, and the advantage of small farms will be obvious. Independently of the two thousand families living in the country, compare the surplus produce sent to market with the surplus produce of any ten thousand acres in one, two, or three hands elsewhere, and see on which side the balance will be found.”\* Surely the particulars mentioned above must be sufficient to establish the truth of the opinion in support of which they have been cited. If they had been known to Arthur Young, they would have induced that candid writer to lay aside his prejudices and to abandon as untenable the position he had taken up. He could not have denied that, tried by his own test, small farms had come off successful, and that they best answered what he had himself pronounced to be the main purpose of agriculture. By what means they accomplish this end is comparatively unimportant. A tree is judged by its fruits, and the conflicting claims of agricultural theories should be determined by observation of their practical results. Improved machines and processes are not valued for some intrinsic virtue of their own—for the mere pleasure

\* Guernsey and Jersey Magazine, Oct. 1837, p. 258.

found in making use of ingenious contrivances, but solely for their effects. The final object for which they are used in farming is to increase the net produce left unconsumed by the cultivator; but if this object can be attained equally well without their aid, surely nothing remains to be desired. The small farmer, though destitute of some of the appliances of the large capitalist, nevertheless manages to get more from the land, and after reserving sufficient for his own consumption, has a larger residue for sale. He might, perhaps, do better still by imitating some of the methods of the large capitalist; but, even as it is, he does better than the other, and his plan must, on the whole, be preferable. To admit that he has the largest produce to dispose of, and yet to quarrel with him because he has not acquired it *secundum artem*, or to sneer at small farms, because, forsooth, they might more properly be styled gardens, is a singular preference of the means to the end. Dr. Purgon might with equal reason have blamed *le malade imaginaire* for persisting in living, when, for his neglect of the rules of medicine, he ought, by rights, to have died.

## CHAPTER II.

## SOCIAL EFFECTS OF PEASANT PROPRIETORSHIP.

THE preceding chapter was principally intended as a vindication of small leasehold farms, although some of the illustrations contained in it were drawn from peasant properties. It is obvious, however, that the arguments urged in favour of the former, apply with greatly increased force to the latter. A small landowner, whose whole produce belongs to himself, is of course richer than he would be if he had to pay rent. He can more easily bear the expenses of cultivation, of procuring proper implements and manure, of drainage and irrigation, and he can keep more live-stock. A small leaseholder can lay out more money on his land in proportion to its extent than a larger occupier; but a small proprietor can spend more than either. He has, besides, very much stronger motives for effecting improvements. "A small proprietor," says Adam Smith, "who knows every part of his little territory, who views it with all the affection which property, especially small property, naturally inspires, and who, upon that account, takes pleasure not only in

cultivating, but in adorning it, is generally of all improvers the most industrious, the most intelligent, and the most successful." It may be added that he is likewise the most liberal. He need not carefully calculate whether an outlay will be fully repaid to him within a certain number of years; he has only to consider whether the increased value of his land will be equal to the interest of the sum which the improvements will cost; he does not require that the principal should ever be returned; he is satisfied to sink it for ever in his own land, provided that in that safest of all investments, it yield a perpetual annuity equal to what would be its annual increase in another employment. Nay, if he be tolerably frugal,—if he spend on cultivation and in the maintenance of his family no more than the leaseholder of a similar property would appropriate to those purposes, he may even grow rich. Inglis tells us that "many Swiss peasants have amassed large fortunes;" in the village of Bergun, in the Grisons, he heard that there were two persons holding money in the British funds, one, 1000*l.*, and the other, somewhat less; and in another village of the same sequestered canton he found two peasants said to be worth each 20,000*l.* sterling;\* and in the Channel Islands, men working in the fields in smock

\* Inglis's *Switzerland*, vol. i. pp. 91, 109.

frocks are frequently pointed out to a stranger as possessors of considerable property. Compare this state of things with England, where Burke's remark, that "a farmer's trade is a very poor trade," still holds good, and where it is still as rare as ever to find an instance of one occupying from 150 to 400 acres, who "after a course of the most unremitting parsimony and labour dies worth more than pays his debts, leaving his posterity to continue in nearly the same equal conflict between industry and want, in which the last predecessor, and a long line of predecessors before him, lived and died." \*

Again, the peasant proprietor has the strongest possible incentives to diligence. A man never works so well as when paid by the piece, but even then the more he is paid the better he works. The small leaseholder, not less than the small proprietor, is paid in proportion to his labour; but the latter is paid at a higher rate, for he takes to himself the whole fruit of his labours, while the former must content himself with part. The proprietor too, knows that as long as his labour continues equally productive, his remuneration will remain the same, while that of the tenant, though augmented solely by his own exertions, may be diminished at the expiration of his lease. Besides, many rural operations yield

\* Thoughts on Scarcity.

no profit until after a long lapse of time, and the annual profit of others is so small, that the enjoyment of it in perpetuity is requisite to recompense the labour expended. Such operations are seldom undertaken except by proprietors. No others would think of planting an orchard such as Arthur Young saw near Sauve, on a tract consisting "seemingly of nothing but huge rocks;" or, as in the mountains of Languedoc, would "carry earth in baskets on their backs to form a soil where nature had denied it;" or would enclose and till fields and gardens on a "wretched blowing sand, naturally as white as snow." But, as Young exclaims, in spite of himself, "give a man the secure possession of a bleak rock, and he will turn it into a garden;" there is "no way so sure of carrying tillage to a mountain-top as by permitting the neighbouring villagers to acquire it in property. The magic of property turns sand to gold."\* Young indeed insinuates that peasant proprietors do these things because they have nothing better to do. He supposes that the ordinary management of their little possessions does not fully occupy them, but leaves them a good deal of leisure, and their "ardour of industry," he says, is so great, that rather than not work at all, they will work for nothing. Hired labourers, on a large farm, we are

\* *Travels in France*, vol. i. pp. 50, 51, 88, 412.

to suppose, would be too fully and too profitably employed to have time to spare for such trifling. But Young might, with perfect safety, have freely indulged his admiration, instead of tempering it with such unjust suspicions. The thousand petty cares, the minute attentions, the labours of love, which are the distinguishing marks of cottage cultivation, do not prevent the cottager from performing, in addition, quite as much of the ordinary business of husbandry as a day-labourer. He digs much harder and more effectually than the other ploughs; but when the hireling has earned his daily wages and gives himself up to rest or amusement, the little landowner merely recreates himself by turning to some lighter work. It is sufficient amusement to him to weed and water his cabbages or train his fruit trees; and in wet or wintry weather, when out-door work is scarcely worth paying for, and when the day-labourer must often remain idle because no one will give him work, then it is that the cottager builds up terraces on the steep hill-side, or lays the site of a garden amongst rocks. Such operations, if executed with hired labour, might not repay their cost in money, and would not be undertaken by monied speculators; but the peasant will perform them on his own account, with no other expenditure than that of labour, which would be otherwise valueless at that particular time. But nothing can be more

unjust than to infer from this circumstance that his labour is at all times of the same small value ; or, because he is content to work for little, when the day-labourer does not work at all, that therefore, at other seasons, when both work, his labour is not as well applied, and as well rewarded, as his rival's.

But whatever may be the absolute merits of small properties, compared with leasehold farms of the same size, they are acknowledged to be preferable in all those respects which we have hitherto considered. They have, however, been subjected to one accusation, to which leasehold farms are less obnoxious, and which, if well-founded, would completely neutralise all their advantages, and would indeed justify their unqualified condemnation as one of the greatest curses with which a country can be afflicted. It is asserted that small properties have a strange tendency to become smaller by subdivision, and that as an increase in the number of properties implies a corresponding multiplication of proprietors, an excessive agricultural population must soon come into existence. An estate may be just sufficient to afford full occupation to its owner, and to enable him to maintain his family in comfort ; but, on his death, his children may divide the land amongst themselves, and may convert their separate shares into so many distinct farms. But if the original property were but just large enough for the employment and maintenance

of one family, the separate portions must each be too small for that purpose; yet the partition need not stop here. In another generation or two, the number of owners may be so much increased, and the size of their respective shares so much diminished, that the whole produce of the land belonging to each family may just suffice to keep it from starvation. A similar partition may take place on every small estate, so that a country entirely occupied by small proprietors may, in the course of two or three generations, be filled with a peasantry as numerous as the whole produce of the soil can preserve in existence. Not only would such a peasantry be reduced to the lowest depth of misery—they would also be the sole inhabitants of their country,—for as, in order to live, they would be obliged to consume whatever provisions they were able to raise, they would have none left to exchange for manufactured goods, no surplus to send to market for the subsistence of a town population. The whole country might be justly described as a vast pauper-warren, and such, we are told, is the fate impending over every country in which the actual cultivators are at the same time owners of the soil.

In inquiring into the grounds for these frightful predictions, our first consolation is derived from the reflection, that they take for granted the right of all the children of a deceased landowner to equal shares in his estate. But peasant proprietorship and the

custom of gavelkind, although commonly found together, are two distinct things, and the first may exist quite independently of the second. Peasant proprietors may be conceived to exist, who should be at liberty to bequeath their lands to whomsoever they chose, or who should be forbidden to divide them into portions of less than a certain size. Besides, it is not obvious why the baneful influence of gavelkind should be confined to small properties, and should not operate on estates of all sizes. If the children of the owner of twenty acres might divide their patrimony into portions of five acres, the inheritors of an estate of twenty times the size might split it into farms of a hundred acres. One of these, on the occurrence of another death, might undergo a second partition, and the grandchildren of the original gentleman-farmer would then sink to the degree of peasants. Thus the only difference between dividing a country into estates of twenty, and into estates of four hundred acres, would appear to be, that the evils apprehended in the former case, would in the latter be retarded by some two generations.

It may, however, be urged, that a peasant's sons have more than ordinary motives for effecting a partition of their patrimony. It has even been asserted that they have no alternative. The younger sons of an agricultural capitalist may seek their

fortunes in trade, but in a country of small farms, a farmer's sons, it has been said, have no means of gaining a livelihood without becoming farmers themselves. Such a country, we are told, "can never furnish surplus produce sufficient, after satisfying the wants of the cultivators, to feed a numerous body of merchants, handicraftsmen, &c., nor would small occupiers have any demand for the products or services of such persons. There could, therefore, be no demand for that surplus population which an agricultural society is always producing, and the division of the paternal properties would be the only way in which families could be provided for."\* Of this it need only be said, that it is a false inference from false premises. It has been shown, that small farms may send to market not only as large, but a much larger surplus produce than an equal extent of land held by large farmers—that they may afford subsistence for more numerous bodies of artisans, manufacturers, traders, and other inhabitants of towns. Consequently, where they abound, the greatest abundance and variety of non-agricultural employments may likewise be found, so that the necessity for adopting the business of husbandry because no other is open to him, should apparently be felt by no man so little as by the son of a peasant proprietor. Mr. Macculloch follows on the same side with arguments which

\* *Encyclopædia Britannica*, Art. Cottage System.

are much more to the purpose, and cannot be so summarily disposed of. Without disputing the young peasant's liberty of choice, he insists much on the preference he is likely to show for the business in which he has been brought up. "The strong predilection," he observes, "entertained by the great bulk of the children engaged in agriculture for the pursuits of their fathers, has been remarked by every one in any degree familiar with rural affairs." Children at liberty to divide their father's estate, possess "the greatest facilities for gratifying their natural inclination." They have "the power of continuing in the line of life in which they have been educated, and which must in consequence be endeared to them by all those early associations which exert so strong an influence over future conduct." Moreover, "the possession of a piece of ground gives a feeling of independence to a small capitalist or a poor man, that he cannot otherwise experience." A possession of this sort may fail to render him comfortable, "but it gives him a security against want. It furnishes him with a cottage, and unless it be unusually small, it will enable him to raise such a supply of potatoes, as will go far to support himself and his family. In no way, therefore, can a poor man be so independent. The possession of a piece of ground renders him in some measure his own master. It exempts him from the

necessity of severe labour and unremitting application." From these considerations Mr. Macculloch concludes, that the children of small landowners will choose "to reside on the little properties they have obtained from their ancestors, and that the process of division and subdivision will continue until the whole land has been parcelled out into patches, and filled with an agricultural population equally destitute of the means and the desire of rising in the world."\*

This reasoning must be acknowledged to possess great force. Mr. Macculloch has made out so good a case, that if the question at issue were merely hypothetical, if it related to what might be expected to take place in circumstances hitherto untried, a decision might not improbably be given in his favour. Arguments on the other side are not indeed wanting, and some shall be forthwith produced; but they may not perhaps do more than make the balance of probabilities equal; facts may need to be thrown in to turn the scale.

Nothing can be said in opposition to the alleged fondness of young country people for a country life—

'Tis born with all : the love of Nature's works  
Is an ingredient in the compound man,  
Infused at the creation of the kind.

---

\* Macculloch's Edition of the *Wealth of Nations*, vol. iv. pp. 462-4.

Man, though immured in cities, still retains  
His inborn, inextinguishable thirst  
Of rural scenes.

In those born and bred amongst them, then, the attachment to such scenes may well be a sort of passion. But the love of country pursuits is common to all countrymen; agriculture is the favourite occupation of agriculturists of every degree, of the gentleman-farmer not less than of the peasant proprietor. The sons of either are equally attached to the business in which they have been brought up, and would make equal sacrifices rather than relinquish it. If the son of an owner of twenty acres would be satisfied with the possession of five acres, so also might the son of a proprietor of an estate of four hundred acres apply himself as contentedly to the cultivation of one hundred. By so doing he would, it is true, sink below the condition in which he was born, and would degrade himself from the rank of a petty gentleman to one little above that of a peasant; but the peasant's son also has a station in society to maintain, he also is ambitious of remaining on an equality with the companions of his youth, and would fear to be looked down upon by the twenty-acre men of his father's acquaintance. Rather than submit to such debasement, he probably, like the young gentleman with whom we have been comparing him, would sell his inheritance, and with the help of the proceeds endeavour to make his

way in some new walk of life. His little capital might not perhaps enable him to establish himself immediately as his own master, and he, like his betters, might be compelled to begin with a subordinate situation; but perhaps also he would have sense enough not to estimate at more than its real value the independence he had forfeited. Certainly he would not value it at all on that particular account on which Mr. Macculloch lays most stress, *viz.*, for the exemption which it would afford from the necessity of severe labour. No one works harder than the peasant proprietor; nowhere could he find a stricter task-master than himself; he is not likely then to refuse to take the service of another from the mere fear of being overworked.

Two advantages land certainly possesses over most other kinds of property: there is less risk of its being lost, and it is tolerably certain to yield some annual produce. The amount may be small—too small perhaps for the comfortable subsistence of the owner, or even for his preservation from want; but it will help more or less to save him from starvation; whereas if the land were sold, and the proceeds invested in trade, the speculation might prove unprofitable, or the money might be totally lost. Suppose that this and other considerations should determine several sons of a small proprietor not to sell the paternal acres, but to trust entirely to them for subsistence:

does it follow that they must divide the land? Would it not be more natural, as well as wiser, to cultivate it in common as in their father's lifetime, and to continue to live together in the family dwelling. They could scarcely be dissuaded from doing so by the fear of not agreeing about the mode of cultivation, or insist upon a partition, in order that each might pursue his own plan of farming, and avail himself of what he might suppose his own superior sagacity.\* Such causes of dissension might well exist among great agricultural capitalists, men whose enterprise and ardour for improvement were proportioned to their means; but they could scarcely have place among peasant proprietors, whose "inveterate retention of local and hereditary usages" furnishes such abundant matter for reproach. Whatever might be their points of difference, they would at least agree in reverencing old established customs, and would probably be only too unanimous in abiding by the rules of their forefathers. Discord might possibly gain admittance amongst them, but would certainly not be introduced by the spirit of innovation.

But it may be argued that without dividing the land, the co-proprietors could not build separate cottages for the reception of their respective families. We have now reached the foundation-stone of the whole theory of the tendency of small properties to

\* Macculloch, *ut supra*.

endless subdivision. It is based upon the assumption that members of the lower classes are apt to marry as soon as they have a prospect of a bare subsistence. This, which is true of the lowest class, where that lowest class is sunk in the depths of destitution, is false of every class enjoying a moderate share of the conveniences of life, and is, in substance, admitted to be false, even by those who maintain it in words. Men do not, in general, marry, when, as a necessary consequence, they must permanently sacrifice their position in society, and adopt a mode of life greatly inferior to that to which they have been accustomed. An Irish beggar, who, being already at the bottom of the social scale, cannot sink lower, and whose means of livelihood cannot well become more defective or precarious, runs no risk of this kind, and need not hesitate to take a wife from among the companions of his wretchedness, as soon as he is rich enough to pay the wedding fees, and to buy potatoes and whisky for the wedding feast. But those to whom fortune has been more bountiful are, in general, proportionably careful not to forfeit her favours by matrimonial imprudence. There are exceptions to all rules, but the son of a man of five thousand a year is seldom content to marry upon a thousand a year, nor the son of a man of a thousand a year on two hundred a year; neither does the son of a proprietor of twenty acres undertake to bring

up a family on the produce of five acres, or the son of an owner of five acres on the produce of one acre. Even the very slight acquaintance with the conveniences of life which the person last mentioned might be supposed to possess, would probably endow him with the requisite modicum of prudence. If he had been brought up sufficiently well to have discovered that there is such a thing as domestic comfort, he would not recklessly throw away his chance of attaining it. If he had passed his youth in a substantial cottage, and had been fed at a tolerably well-covered table, he would not be satisfied with Mr. Macculloch's magnificent dowry of a hovel and a sufficiency of potatoes. He would have a standard of comfort; not a very high one perhaps, but one below which he would, nevertheless, be anxious not to fall; for peasants, as well as peers, are little disposed to forfeit, by their rashness, advantages to which they have been accustomed. Indeed, the owner of a small piece of ground yielding little more than enough for his own maintenance, is the less likely to marry without adequate means, as he of all men is in least danger of over-rating his resources. If his farm were larger, or if he were a day-labourer, his gains would depend, in a great measure, on changes in the market, or in the rate of wages, and his income being uncertain, might be reckoned at more than its real amount. But as it is, he is liable

to no such mistake. He knows pretty accurately what is the annual average produce of his land, and how much, if at all, it exceeds the quantity required for his own use. He has no accidental sources of increase to look to, and no excuse for trusting anything to chance. He cannot expect that two stalks of corn will grow where but one grew before. He can calculate, almost without the possibility of serious error, the exact amount of his income, and whether or not it will enable him to maintain a family; and if it is insufficient for that purpose, it would be pure insanity in him to marry. It is more charitable to suppose that he would remain single until some favourable change should take place in his circumstances, until he could captivate some village heiress, or obtain an accession to his little territory by the death of a relation. Until then, he would have no adequate motive for requiring a partition of the property held by him in common with his brothers, and when he did demand his separate share, he would do so in order to annex it to the other lands which he had acquired by marriage or inheritance. In this manner, properties when divided might immediately be recomposed, and their average size might remain undiminished.

This question does not, however, depend entirely upon argument, and need not be determined merely according to the balance of probabilities. It has been.

submitted over and over again to actual experiment. Ever since the flood it has been almost constantly under trial, and abundant evidence whereon to found a confident judgment may be procured, either from the records of the past, or from observation of the present.

The pastoral tribes by which most civilised countries were originally occupied, have almost invariably been followed, either immediately, or after a certain interval, by a race of peasant proprietors. The revolution has taken place at different stages of national progress, but scarcely an instance can be mentioned in which it has not occurred sooner or later. In territories of very small extent, very barren, or much divided by mountains, rivers, or other natural barriers, it has commonly been effected as early as the first appropriation of land by individuals. In such situations the original tribes of wandering herdsmen must necessarily have been small for want of pasture, and the same cause must have prevented any individual from acquiring very great numbers of cattle, and from very greatly surpassing his companions in wealth or power. All must have been nearly equal in rank, and whenever a partition of their common territory was resolved upon, every one, no doubt, made good his claim to a share. On the other hand, in countries containing abundance of good pasture, separate tribes may have attained to a very considerable size,

and the cattle of single proprietors may have been counted by thousands and tens of thousands. Great wealth implies great disparity of rank, and rich herdsmen must have had many poor retainers entirely indebted to their bounty for subsistence, and consequently perfectly devoted to their service. Such dependents, when the community passed from a migratory and pastoral to a stationary and agricultural condition, could put forward no pretensions on their own behalf. Their relation to their masters continued the same as before, or, rather, it was exchanged for a more stringent bondage. From servants they became serfs, and the duty assigned to them was to till their master's fields, as they had formerly tended his herds. In the course of ages, however, they imperceptibly acquired some important privileges. Residing for many successive generations on the lands allotted to them to cultivate, and paying to their lord always the same, or nearly the same, portion of the produce, they came at length to be regarded as conditional proprietors of their respective holdings, or as perpetual lessees, at a quit and almost nominal rent. Their proprietary title, although at first merely prescriptive, was eventually legalised, either tacitly or by positive enactment; and thus from villains and serfs have descended no less respectable a progeny than English copyholders and German bauers.

In one or other of these ways, almost every country on the face of the globe which has passed regularly through the various stages that separate barbarism from civilisation, has been at some period, as many are still, occupied by peasant proprietors. Ample opportunity must consequently have been afforded for the development of those evils by which every community so constituted must, it has been said, be inevitably overwhelmed. Let us inquire, then, whether the apprehensions of certain writers have ever been realised; whether one single country can be named in which landed property has been so minutely divided that the produce barely sufficed for the consumption of the cultivators; in which there were no towns, no manufacturers, no artisans, none but a rural and agricultural population, and that plunged, as it assuredly would be, in the circumstances supposed, in destitution and barbarism.

Our first example shall be taken from Jewish history. It is evident from the Scriptural account of the occupation of Canaan by the Israelites, that the land was divided among the whole people, and that although the partition was made without perfect regard to equality, still every head of a family obtained a share. Moreover, extraordinary precautions were taken to prevent an allotment from ever passing away from the descendants of the first grantee. If poverty compelled any one to sell part of his domain, he might at

any time redeem it by returning what would remain of the purchase-money, after deduction of the annual profit which the purchaser had made while the land had been in his possession. Even if the land were not redeemed, it could only be retained by the purchaser until the jubilee, which took place once in fifty years, and was then to be restored unconditionally to the seller. Thus the consolidation of estates was very anxiously guarded against, since it could not legally occur except when a family became extinct; but no precautions were adopted against the opposite evil of excessive subdivision, to which indeed the law afforded every facility. The only inequality which was sanctioned in the partition of an inheritance, was that the eldest son should obtain a double portion; the remainder of the property was to be divided equally among the other sons, or among the daughters, if there were no sons. Thus were united the conditions required by the theory we are examining—peasant proprietorship and a custom of inheritance differing very slightly from gavelkind,—yet the consequences were the very opposite of those which, it is said, would have ensued. Landed property among the Israelites never became too much subdivided; on the contrary, the prophets inveigh loudly against its unjust consolidation, and as long as the Mosaic code was faithfully administered, poverty was almost literally unknown. Five hundred years after the death

of the lawgiver, when ample time had been allowed for the development of whatever germs of evil his system contained, few or no instances could be found of destitute persons, whose indigence was not the result of their own misconduct. David did not hesitate to say, that in the whole of his life he had never "seen the righteous forsaken, nor his seed begging bread;" and this assertion, which might otherwise be regarded as an Oriental hyperbole, may very likely have been strictly correct in a country of peasant proprietors. At this day, the bailiff of Guernsey, confining his observations to the natives of his own island, might, with perfect truth, use the same, and even stronger language than that of the King of Israel. Certainly, there is not a beggar within the limits of his jurisdiction, and an able-bodied person very rarely, if ever, seeks admittance into either of the two hospitals or asylums for the poor. The security against want possessed by the ancient Israelites is expressly stated to have been of the same nature as that of the present inhabitants of the Channel Islands. To every family belonged a portion of land which only needed to be diligently cultivated to maintain its owners in plenty. He who tilled his land, Solomon tells us, had plenty of bread. Those only who kept idle company, and neglected their business, suffered from poverty.\* Such was the state of things while the law of Moses

\* Prov. xxviii. 19.

continued in full force, but under the later kings its authority became insufficient for the protection of the peasantry, whose rights were then frequently set at naught. We may be sure that the tyranny of Ahab found many imitators among his licentious nobles, if, even in the days of good Hezekiah, the Lord "looked for judgment, but behold oppression; for righteousness, but behold a cry."\* The cry was the same that was heard, and the oppression the same that was practised long afterwards in England, in the time of the Tudors, when "husbandmen were thrust out of their own" by their rich neighbours, who, with the assistance of their "man of law," would "pretend some title," and sometimes "by covin and fraud," sometimes "by violent oppression put them beside it, or by wrongs and injuries so weary them, that they were compelled to sell all."† Even so, ages before, in Palestine, did Scribes and Pharisees, whose legal knowledge gave them peculiar facilities for interfering in questions of disputed inheritance, defraud the fatherless, and "devour widows' houses." So did rich landholders "covet fields, and take them by violence; and houses, and take them away: so did they oppress a man and his house, even a man and his heritage."‡ So did they "join house to house," and

\* Isaiah, v. 7.

† See Sir T. More's *Utopia*, and Massinger's *New Way to Pay Old Debts*.

‡ Micah, ii. 2.

"lay field to field, till there was no place, that they might be placed alone in the midst of the earth."\* This is something very different from the minute division we were bidden to expect; and it is highly deserving of notice, that pauperism, which is said to be inseparable from small properties, scarcely made its appearance in Palestine until separate properties were forcibly united. From that time, indeed, the Jews seem to have had "the poor always with them," although, as the main body of the peasantry, notwithstanding the grievous injustice inflicted on individuals, were never probably very generally dispossessed of their proprietary rights, the poor may never have formed a very numerous class. Those of whom the Scriptures afford us glimpses were chiefly infirm of body or mind, sick, halt, maim, or blind.

The primitive Romans were likewise peasant proprietors. The *ager Romanus*, the original territory of Rome, extended in no direction more than five miles from the walls; and as, for some time after the foundation of the city, it constituted the entire property of the three patrician tribes, who were at first the only inhabitants, the portion belonging to each proprietor must have been exceedingly moderate. So late as the third century of Rome, the haughty Cincinnatus is said to have received the news of his nomination to the dictatorship while digging or

\* Isaiah, v. 8.

ploughing in his little farm of less than three acres;\* and the story, whether true or false, proves equally, that when Livy wrote, tradition still preserved the memory of a time when the noblest citizens could dispense with the aid of hired labourers, and worked with their own hands for their own subsistence. Nor was this mode of life peculiar to the Romans; it was common at the same period throughout Latium, as well as in many other parts of Italy. Most of the little precipitous cliffs, in which terminate so abruptly the low hilly ridges of the now desolate Campagna, were once surmounted each by its citadel, rising out of a collection of houses inhabited by the petty freeholders of the adjoining canton. When these little towns were subdued, after a succession of bloody contests, the remaining inhabitants of some were compelled to take up their residence in Rome, and Roman colonies were placed in others, but in no case were the conquered people allowed to retain the whole of their former territory. Part was invariably confiscated, nominally for the benefit of the Roman government, but often in reality for the exclusive benefit of the patricians, who frequently divided the so-called public domains amongst themselves, and became, in consequence, immensely rich. But although the aristocracy were thus exalted, the bulk of the nation, the Roman commons, consisting

\* *Quatuor jugerum agrum.* A juger contained 28,800 square feet.

of the descendants of the several conquered nations, retained for some time longer their ancient social position, the subsistence of a family being commonly derived from the portion of land which it possessed in full property. That in the early ages of the Republic, some freehold property was considered essential to personal independence, may be inferred from the fact, that when, soon after the sack of Rome by the Gauls, four new tribes were created, a grant of seven jugers (between four and five acres) was made to every family; and it also seems probable, that the size of these grants was determined by the average size of the plebeian freeholds previously existing. The great mass of the Roman commons may be presumed to have been proprietors, possessing on an average nearly five acres each. In many other parts of Italy, landed property was not less divided than in Latium. In Samnium, Sabinum, and generally in the highlands of the Apennines and Alps, the peasantry were undoubtedly freeholders; and even in Etruria, where the native Pelasgi had been reduced to vassalage by foreign conquerors, they retained at least the same proprietary rights as the serfs of modern Europe.\* Held either by a free

\* The prevalence of peasant proprietorship in Etruria, may, I think, be inferred from the following remark of Varro, preserved by a scholiast on Virgil, though Dr. Arnold (*Hist. of Rome*, vol. ii. p. 107), from whom I take the passage, places a different construction upon it. "*Terra culturæ causâ attributa olim particulatim hominibus, ut Etruria Tusci, Samnium Sabellis.*"

or by a servile tenure, the lands cultivated by the native peasantry throughout the peninsula, seem to have belonged to themselves. It must be added, that the Roman law of inheritance resembled that of Moses so far as to require the property of a man dying intestate to be equally divided among all his children. Such having been the distribution of land in ancient Italy, and such the facilities for its further partition, what consequences ensued? Did the land become continually more and more subdivided, and did the proprietors, daily growing more numerous, sink daily deeper and deeper into indigence and misery? On the contrary, the lordly usurpers of the public domain rapidly displaced their humble neighbours, and annexed fields and gardens to their own overgrown estates. This is, indeed, the danger really to be apprehended in all similar circumstances. Comparatively little care is required to prevent the division of peasant properties: of that there need be no fear, provided they be in the first instance of a suitable size, and provided, also, that their owners enjoy the protection of equitable law. The true difficulty is to save them from the grasp of the rich and powerful, who have everywhere too many expedients for seizing upon the possession of small landowners. Open violence and legal fraud, or where neither of these can be resorted to, the temptation of a high price, are influences which

magnitude, was formed, but its situation was in the city, not in the country, and its foundations were laid simultaneously with the consolidation, not with the subdivision, of landed property. The progress of pauperism, not less than the decline of agriculture, might have prompted Pliny's celebrated remark, "that large estates had ruined Italy."

Compare the condition of this idle, dissolute, turbulent mob, with that of the Roman commons, while they were still landed proprietors. It cannot be denied that even then their situation was sufficiently precarious, that they were liable to sudden reverses of fortune, and were frequently plunged into deep distress. It is equally certain, however, that their misfortunes had no connexion with the size of their farms, but arose from very different and very peculiar causes. In the incessant warfare carried on with the neighbouring states, their lands lying nearer the frontier than those of the patricians were peculiarly exposed to the ravages of an invader; and when their crops were destroyed, or their cattle carried off, they were compelled to borrow money of the patricians, whose most valuable estates were nearer the city, and who had besides some sources of revenue independent of the land. Or they might be reduced to the same necessity by the enormous taxation required to meet the expenses of war, which fell with more than ordinary weight on the lower

classes ; and if any one after borrowing were unable to satisfy his creditor at the appointed time, his debt was speedily raised by the accumulation of interest, to an amount which he could never hope to pay. The atrocious law with respect to bankrupts then left him no choice, but either to surrender his patrimony, or himself to become his creditor's slave. Many submitted to the latter alternative ; but this very circumstance seems to show that notwithstanding the severe calamities which occasionally overwhelmed them, the ordinary condition of the commons was sufficiently comfortable. It has been much debated by some of the most eminent political economists whether the employment of slave or of hired labour be the more advantageous ; and the question has received very different answers, as indeed was no more than natural, for the truth itself is very different in different situations. The maintenance of a slave (provided his master understand his own interest) may be expected always to cost the same sum ; just so much as will keep him in the most perfect state of health and strength, and neither more or less. But the wages of free labour vary with the supply, being sometimes a great deal more and sometimes considerably less than the expenses of a slave's subsistence ; and in the former case only can slave labour deserve a preference. In thinly-peopled countries, such as America for example, in

which wages are very high, the temptation to employ slaves may be too strong for human virtue ; while in a densely-peopled territory like England, (to say nothing of Ireland), no man would take a slave as a gift, for he could procure the more efficient service of a freeman at a much lower price. Now the wealthy Romans began very early to employ their enslaved debtors in rural labour, for numbers of such bondsmen working on their creditors' land were released by the mutinous soldiers on their march from Campania towards Rome, in the famous sedition of the year 340 B.C. There could have been no motive for this employment of insolvent debtors if free peasants could have been persuaded to undertake the same work on moderate terms ; but the latter no doubt demanded higher wages than it suited the masters to give. Their little farms furnished them with full occupation, and remunerated them so liberally that they were little inclined to accept employment elsewhere. Possibly, it may be thought that these proofs of their prosperity in ordinary times, when neither impoverished by war nor ground down by taxation, might have been dispensed with ; and a less elaborate argument might no doubt have sufficed to render it probable, that a man cultivating his own portion of five acres, would derive from it a much larger income than a large farmer could allow to a hired servant.

A very brief reference to Greece will suffice to show that her small proprietors of the heroic and republican periods never multiplied into a swarm of paupers. Polybius remarked that in his time, although one of concord and comparative prosperity, afflicted neither by wars nor by epidemic diseases, population was fast diminishing, so that houses were left empty, and cities resembled abandoned hives. Strabo, who visited Greece about a century after its incorporation with the Roman Empire, was surprised by nothing so much as the scarcity of inhabitants. Messenia was for the most part deserted; Laconia contained but thirty of the hundred small towns for which it had once been celebrated; Arcadia, Ætolia, and Acarnania were solitudes. Of the towns of Doris and of the Ænians scarcely a trace was left. Of all save three of the Bœotian cities nothing remained but ruins and names. In the reign of Trajan, according to Plutarch, the whole of Greece could not furnish more than three thousand heavy armed men—the number raised by Megara alone for the Persian war.\* Bishop Thirlwall, adopting in part the opinion of Polybius, attributes this remarkable depopulation to universal luxury and depravity of morals; but these are plagues whose contagion seldom extends beyond the wealthy classes and the inhabitants of cities. A better explanation is afforded

\* Thirlwall's *Hist. of Greece*, vol. viii. pp. 460-7.

by what Strabo says of the accumulation of property in few hands. The whole island of Cephalonia formed but a single estate, and in continental Greece scarcely any land was in tillage, almost the whole being occupied by vast sheëpwalks, or by pastures for cattle and horses. Desolation had evidently run the same course in Greece as in Italy. Many small farms had been united to form a few enormous estates. The new landlords had expelled the remains of the ancient peasantry, and having cleared their domains of men, had supplied their places with herds of beasts. Modern Highland lairds may perhaps be glad to learn that their own clearances can be justified by such illustrious precedents.

Descending from remote antiquity to times comparatively recent, we may collect from the records of our own country evidence similar to that which has been already produced. England was never, strictly speaking, a country of peasant proprietors, but always possessed among her inhabitants a considerable class of extensive landowners. Interspersed with large estates, there were, however, throughout the middle ages, a far greater number of cottage farms held on various conditions. Some were the freeholds of their cultivators ; others, though scarcely less the property of the tenants, were held by a servile tenure ; some again were leasehold, and some held at will by labourers who had obtained them in payment of their

services, and in lieu of wages. So general was the tenancy of land by the English peasantry previously to the accession of the first Tudor monarch, that the converse of Goldsmith's well-known distich might then have been not inapplicable. Although every rood of ground did not maintain its man, there were few rustics who were not either owners or tenants, not merely of a rood, but of several acres. Of the adequacy of these possessions to supply their occupants with abundance of the necessities of life, we have the most satisfactory proof, and for the hundred and fifty years ending with the fifteenth century, the chain of testimony is particularly complete. Fortescue, Lord Chief-Justice to Henry VI., dilates with contagious exultation on the plenty enjoyed by the lowest class of his countrymen. "They drink no water," he says, "unless it be so that some for devotion, and upon a zeal of penance, do abstain from other drink ; they eat plentifully of all kinds of flesh and fish. They wear fine woollen cloth in all their apparel : they have also abundance of bed coverings in their houses, and of all other woollen stuff. They have great store of all hustlements and implements of household. They are plentifully furnished with all instruments of husbandry, and all other things that are requisite to the accomplishment of a quiet and wealthy life, according to their estates and degrees."\*

\* Fortescue de laud. Leg. Angliæ, pp. 85-6.

Fortescue was an avowed panegyrist, and his statements might require considerable abatement if they stood alone, but their perfect accuracy is placed beyond dispute by the most unimaginative and matter-of-fact of all compilations, the statutes at large. Repeated enactments passed during the period we are examining, use language quite as strong, and still more precise and circumstantial than that of the patriotic Chief-Justice. In addition to laws designed to keep down the wages of agricultural labour, others were directed against the luxury of the peasantry. In 1363\* carters, ploughmen, and all other farm servants, were enjoined not to eat or drink "excessively," or to wear any cloth except "blanket and russet wool of twelve pence." Domestic servants were at the same time declared to be entitled to only one meal a day of flesh or fish, and were to content themselves at other meals with "milk, butter, cheese, and other such viands." In 1463† servants in husbandry were restricted to clothing of materials not worth more than two shillings a yard, and were forbidden to wear hose of a higher price than fourteenpence a pair, or girdles garnished with silver. The price of their wives' coverchief or head-dress was not to exceed twelve pence. In 1482‡ these restrictions were loosened, and labourers in husbandry were permitted to wear hose as dear as eighteenpence a

\* 37 Edw. 3, c. 14.

† 3 Edw. 4, c. 5.

‡ 22 Edw. 4, c. 1.

pair, while the sum which their wives might legally expend on covering for the head was raised to twenty-pence. This legislation, considering the fall which has since taken place in the value of money, was really much as if a law should now be necessary to prevent ploughmen from strutting about in velvet coats and silk stockings, with silver buckles in their shoes, and their wives from trimming their caps with Brussels lace. It exhibits agricultural labourers in a condition which was probably never attained by the same class in any other age or country, unless, perhaps, by the emancipated negroes of the British West Indies. Yet the description applies only to the lower order of peasants—to those who worked for hire, and had either no land or none but what was allowed them in part payment of wages. What, then, must have been the prosperity of the small freeholders and cottage farmers?

It is true that, in the midst of this abundance, the English peasantry of the middle ages ate off wooden platters, never knew the luxury of a cotton shirt or of a cup of tea, and slept on straw pallets within walls of wattled plaster, and that in some counties they used barley instead of wheaten bread. But it is absurd to imagine that, because they had to put up with these inconveniences, their situation, in more important respects, was not immeasurably superior to that of their living descendants. Nothing more is to be

inferred than that certain modern refinements and conveniences were unknown and uncoveted by them. Many advantages of an advanced civilisation, which are now within every one's reach, were once equally unthought of by rich and poor. Our Plantagenet kings, as well as their courtiers, were fain to drink beer at every meal, and to drink it, too, out of wooden bickers; they were as ill provided with under linen as the meanest of their subjects; and so little did they regard what are now considered the most indispensable requisites of domestic comfort, that the bedchamber furniture of so magnificent a monarch as Henry the Eighth consisted only of a couple of joint cupboards, a joint stool, two hand irons, a fire fork, a pair of tongs, a fire-pan, and a steel mirror covered with yellow velvet.\* At this day little of any grain beside oats is used in many respectable families in Scotland; and many a continental baron, whose domain stretches for miles around his princely chateau, seldom eats any but rye bread. This is mere matter of taste, and no one would think of mentioning it as a mark of social inferiority; but it would be

\* Pict. Hist. of Eng., vol. ii. p. 880. The Spaniards who came to England in Queen Mary's time, wondered when they saw the large diet used by the inmates of the most homely-looking cottages. "The English," they said, "make their houses of sticks and dirt, but they fare as well as the king."—See Bernan's Hist. and Art of Warming and Ventilating Rooms, &c.; a work abounding with curious matter, of which the title gives little promise.

quite as reasonable to do so as for a modern day-labourer at eight shillings a week to look back with pity on his well-clad, beef-fed ancestors, because some of his own rags are made of cotton, and because the baker, of whom he now and then buys a loaf, sells only wheaten bread.

It is also true that the peasantry of the Anglo-Norman period suffered grievously from feudal oppression, and from private and civil war; and that a bad harvest was invariably followed by a local famine, which, aided by pestilence, its first-born son, committed ravages unheard of in later times. It is even possible that the evils arising from these sources, although only occasional, may have been as intolerable as the habitual privations of agricultural labourers of the present day; and that the latter, living in peace under equitable laws, and possessing, in the extension of commerce, an assurance that their supplies of food will not be utterly cut off, have, on the whole, little cause to regret the change which has taken place in the condition of their class. This, however, is not the question. We are not balancing the advantages of rude and precarious plenty against those of civilised and uniform penury; we have only to satisfy ourselves that this plenty was anciently the portion of the English peasantry, and that the latter, in ordinary times, obtained from their lands the means of amply supplying their homely wants. This is the

only point with which we are at present concerned; and surely if any dependence can be placed on history or national records, it has been established beyond the possibility of dispute.

No argument can be required to prove that English peasant properties, though subject to the custom of gavelkind, escaped the evil of excessive partition; for consolidation, the reverse of subdivision, must have been everywhere adopted before the face of the country could be covered almost entirely, as it actually is, with large estates. To relate how the consolidation was effected, is but to repeat, with slight variations, the story already told of Palestine and Latium. In the latter part of the fifteenth century, pasturage began to be regarded as a more profitable employment of land than tillage, and in order to afford room for its adoption on a sufficiently extensive scale, many farmhouses and cottages were pulled down, and the fields belonging to several were sown with grass and let to a single tenant. Not only were "tenancies for years, lives, and at will, whereupon most of the yeomanry lived, turned into demesnes"\* in this manner, but freeholders also were ejected from their lands by force or fraud, or were harassed or cajoled into a sale of them.† Simultaneously with this social revolution,

\* Lord Bacon's Hist. of Henry VII., Works, vol. v. p. 61.

† More's Utopia, St. John's Edition, pp. 32-4.

a new social malady made its appearance. As long as the connexion of the peasantry with the land remained unbroken, England was perfectly free from every symptom of pauperism, and the supply of labour, instead of exceeding the demand, was so deficient as to induce parliament to interfere to keep down its price. But almost immediately after the consolidation of small farms commenced, legislation took a different turn, and parliament, instead of striving to curtail the labourer's honest earnings, had to exercise its ingenuity in providing for a rapidly increasing crowd of destitute, for whom no work could be found. The progress of pasturage and augmentation of farms seem not to have attracted much notice until the year 1487, when an act was passed to restrain them, and just seven years later commenced a series of statutes which attest the rapid spread of destitution. For a time, misled by the experience of the preceding age, parliament imagined idleness to be still the fruitful parent of the evil, and punishment its most effectual cure: no other asylum, therefore, was offered to able-bodied vagrants than the stocks, and no milder treatment than whipping at the cart's tail. After being "admonished" in this way, they were to be sent to the place of their birth, there to set themselves to work "as true men ought to do." Such were the provisions of the law of the year

1494.\* In 1535, however, it was discovered that the aforesaid "valiant vagabonds," after returning home, could find no work to do, and the parish authorities were in consequence enjoined to collect voluntary contributions for the purpose, not only of relieving the impotent and infirm, but of enabling the strong and lusty to gain a living with their own hands.† In 1547, the number of beggars still rapidly increasing, in spite of the "godly acts and statutes" already directed against them, another was passed, which, though repealed two years afterwards, deserves to be mentioned, not merely on account of its astonishing barbarity, but as showing how genuine the distresses of the lower classes must have been which even such atrocious measures could not induce them to conceal. It was enacted, that every able-bodied person found loitering about should be branded with a hot iron and adjudged to two years' slavery to the man by whom he had been apprehended, during which time he might be fed upon bread and water and refuse meat, and forced to work by beating or otherwise ; that if he ran away, he should be branded a second time, and should be condemned to slavery for life, and that if he absconded again, he should suffer death as a felon.‡ Threatened with slavery, stripes, and death, men chose to run every

\* 2 Hen. 7, c. 2.

† 27 Hen. 7, c. 25.

‡ 1 Edw. 6, c. 3.

danger in seeking to better their condition rather than pine with hunger at home, and beggars and vagabonds continued daily to increase. In 1562 voluntary alms being found insufficient for the relief of the poor, the parish authorities were empowered to assess persons obstinately refusing to contribute.\* Mendicancy and vagabondage continuing still unabated, in 1572 † power was given to tax all the inhabitants of a place for the relief of its poor. Other acts followed; and in 1601 the necessity of providing employment for the able-bodied poor by means of parochial assessments was formally admitted, the famous Elizabethan law was passed, ‡ and thanks to the abandonment of the "cottage system," that first step as many imagine in the improvement of agriculture, England was saddled with a permanent poors' rate, which has now become an annual tax of six millions sterling.§

We have now seen, that in ancient Palestine, Italy and Greece, and in England, peasant proprietorship did not conduce to pauperism, but that, on the contrary, as long as it continued in vigour, pauperism was utterly unknown, and did not make its appearance

\* 5 Eliz. c. 3.

† 14 Eliz. c. 5.

‡ 43 Eliz. c. 2.

§ Most writers on the subject have attributed the growth of pauperism, at the period in question, to the dissolution of monasteries by Henry VIII.; but this opinion seems to be refuted by the single fact, that monasteries were not abolished till 1535, many years after the continual increase of vagrancy had become a standing topic of parliamentary lamentation.

until small properties began to be united. But we are not dependent upon history for our proofs of the enduring prosperity of peasant proprietors. They still form the bulk of the rural population in many territories, to any one of which we may turn with full assurance of discovering unmistakeable signs of rural happiness. The *bonder* of Norway, for instance, have, from time immemorial, been owners of their respective farms, which, moreover, have always been legally liable to division among all the children of a deceased proprietor; yet the division of land has made so little progress in the course of many centuries, that very few estates are under forty acres, and very many are above three hundred acres, independently of an extensive tract of mountain pasture belonging to every farm. Some idea of the condition of the farmers may be formed from the following particulars respecting the farm servants. These, if unmarried, are lodged in an outhouse adjoining their master's dwelling, which it resembles in appearance, neatness, and comfort; they are allowed four meals a day, consisting of oat or bean-meal, rye-bread, potatoes, fresh river and salt fish, cheese, butter, and milk; and once or twice a week they have meat, sometimes fresh, but more frequently in the shape of salt beef or black puddings. At one of their meals they have also beer or a glass of potato spirits. Their money wages, in addition to all this, are about

fourpence halfpenny a day. A married labourer lives on the outskirts of the farm in a cottage of his own, generally "a good log house of four rooms with glass windows," which is held on lease for the lives of himself and his wife, together with a piece of land large enough for the keep of two cows or a corresponding number of sheep and goats, and for the sowing of six bushels of corn and three quarters of potatoes. The usual rent of these tenements is from four to six dollars, and is commonly paid for by work on the main farm, each day's work being valued at a fixed rate of threepence or thereabouts. After the labourer has paid his rent, he is allowed his food as well as the usual money-payment for every additional day's work. It need scarcely be said that a houseman, as a married labourer of this kind is called, is in a very comfortable situation; in fact, he wants few, if any, of the comforts which his master possesses; his house, though smaller, is as well built; his food and dress are of the same materials. The peasant proprietors, like their servants, are satisfied with articles of home growth, and are little desirous of foreign luxuries. They build their own houses, make their own chairs, tables, ploughs, carts, and harness. Their wives spin their own flax and wool, and weave their own linen and woollen cloth; almost everything they use is the produce of their own farms, except glass, pottery, and iron ware, sugar, coffee, spices, and

tobacco. The accumulation of so many tasks upon the same person no doubt causes them to be unskillfully performed, and marks, besides, a rather backward stage of civilisation. It must not, however, in this instance, be mistaken for a sign of poverty. A Norwegian peasant does not content himself with home-made goods because he has no surplus agricultural produce to exchange for the manufactures of towns: but the nature of the climate confines him within doors for many months of the year, when he is compelled to seek some sedentary employment, if only for a pastime. Whatever were his means, and however cheaply he might buy the articles he requires, he obtains them still more cheaply if he can get them made at home, for they then cost nothing but labour, which if not so employed would be utterly wasted. In such circumstances division of labour, instead of increasing the productiveness of industry, would condemn industry to spend half her time in idleness, and that instinctive knowledge of political economy, usually termed common sense, accordingly prevents its adoption. But although the mode of life of the Norwegian country people may be somewhat rude, it would be difficult to find a happier race; they enjoy plenty, and are content; they care little for outward show, and are exempt from the painful desire to outvie their neighbours, which makes many wretched in the midst of comfort. Almost the only

thing in their condition which is much to be regretted, is the deficiency of mental culture, which prevents their turning their leisure to the best account, and heightening their material enjoyments with intellectual pleasures. Would to God that labourers on large estates in other countries had as little to sigh for.\*

The Swiss peasantry, although almost universally landed proprietors, may be divided into two classes: those who are principally or exclusively agriculturists, and those who gain a livelihood chiefly by manufacturing industry. The farms of the former, except in the cantons of Berne and Tessin, and a few other districts, seldom exceed forty or fifty acres, but they are as rarely of less size than ten acres, and the poorest farmers, having rights of pasturage on the common lands belonging to every parish, can afford to keep two or three cows. Members of this class are always in the enjoyment of competence, and many of them possess considerable wealth. Besides these, however, there is a more numerous body of smaller proprietors, whose territorial possessions consist only of a field or two, altogether not larger than an ordinary garden, and much too small for the maintenance of the family to which they belong. Here there may seem to be an instance of excessive subdivision. But the owners of these patches of land are almost invariably manufac-

\* Laing's Norway, *passim*.

turers rather than husbandmen: they constitute indeed the bulk of the manufacturing population of a country which has but two superiors in manufacturing importance. Most of the cotton and silk goods of Switzerland are produced in the rural districts of Zurich, Basle, St. Gall, Appenzel, and Argovia; and even of those famous Swiss watches so much admired for their delicacy and beauty, as many come from *chdlets* among the mountains of Neuchatel as from the workshops of Geneva. In England, the makers of these articles would have been pent up in towns, and compelled to pass their days in close dismal factories; but in Switzerland, a happy combination of circumstances permits them to practise their business without forfeiting the use of fresh air or other advantages of a country life. But although retaining the name and all the privileges of peasants, they gain their living principally as manufacturers: land is valued by them as affording a means, not so much of employment as of amusement, and they require no more of it than will suffice to occupy their leisure. This affords a clue to the true explanation of the minute partition which has taken place. The ancestors of the rural manufacturers were no doubt originally agricultural peasants, possessing farms of suitable size; but the climate, which confined them much within doors, led them to choose some manufacturing occupation for the winter months, which

proving equally or more profitable than husbandry, was eventually adopted by many as their chief pursuit. On the death of a peasant artizan, his children would very probably divide their patrimony, and each might build a separate cottage; but they would do so, not with the intention of subsisting on the produce of their respective portions, but because independently of that produce they possessed other means of subsistence. In the outskirts of one or two English towns, patches of garden ground are rented by a few operatives, who are not the less operatives because they amuse themselves with gardening and grow their own vegetables; neither is the smallness of their allotments regarded as a mark of inferiority in their social position. The difference between such operatives and those of Switzerland is, that the latter, besides possessing more land, and besides being owners instead of mere renters, are not confined to towns, but are spread over the whole country, and have their fields and gardens immediately adjoining their dwellings. They are manufacturers deriving from land a small addition to the earnings of their principal occupation, and it would be strange if the accession of income so obtained were otherwise than beneficial to them. In reality, it is not merely beneficial; it may be acknowledged to be often indispensable to supply the deficiency of their other sources of revenue. Situated as they are

in the centre of Europe, and paying an enhanced price for the raw materials of their fabrics, they are placed at a great disadvantage with respect to manufacturers of other countries, with whom they are enabled to compete only by accepting lower wages. Their wages alone would indeed scarcely suffice for their subsistence. As their plots of land are too small to afford them a livelihood without the aid of their manufacturing earnings, so would their wages be insufficient for their maintenance without the addition of their garden produce, while both united secure to them the enjoyment of ample comfort. To this every one who has inquired into the subject bears testimony. "It is impossible," says Dr. Bowring, "to mistake the value of a policy whose results are to be traced in general content, in general prosperity. I am acquainted with no country in which prosperity has descended so low, and spread so widely, as among the laborious classes of the Swiss manufacturing districts. I was surprised to find what large proportions of them had by their savings acquired landed property; how many of them dwelt in houses and cultivated fields and gardens which their industry had made their own. In the mountains of the Jura and Appenzel, along the borders of the lakes of Zurich and Constance, everywhere, indeed, where the operatives are settled, I found in their habitations a mass of enjoyments,

such as are possessed by few of similar station in other countries." \* A weaver in Argovia, says Mr. Symons, "is almost universally the proprietor or the son of a proprietor of land, and few householders are there in the whole canton who do not keep a pig, and generally a few sheep. Their cottages are strewn over the hills and dales, and exhibit in the interior every degree of comfort and ease. The meals of the semi-agricultural, semi-manufacturing population of Zurich are as good as they themselves desire, and their clean and comfortable houses bespeak their easy circumstances. The cottages of St. Gall and Appenzel are scattered separately over the vales and hills, each standing in the midst of its little estate, with the goats or sheep with their melodious bells around their necks grazing on the land, which is generally pasture. The interiors of the cottages, which are built of wood, are cleanly beyond description, and are well furnished with every article of cottage comfort. Appenzel is in fact the Arcadia of Switzerland, and it would be hopeless to expect any person who had not witnessed the circumstances of the peasantry, and the aspect of their abodes, to appreciate from mere description the exceeding beauty, social and scenic, which it exhibits. In the Grisons, wages are, as far as mere money goes,

\* Bowring's Report on the Commerce and Manufactures of Switzerland, pp. 3-6.

extremely low, and if taken as a standard of condition, would indicate a degree of poverty beneath the Irish peasant, whilst the real condition of the population is decidedly preferable to that of English farm labourers.”\* Mr. Symons sums up, by expressing his conviction, “that it would require thirty shillings per week in England to place a man with a wife and three children on a footing with the average of Swiss peasants, having the same family.” Mr. Macculloch objects to this as “a very exaggerated statement;” but Mr. Symons appears to have anticipated the objection, for, after specifying the various articles which an Englishman might be expected to purchase with thirty shillings a week, he adds, “I fearlessly assert, that this amount of comforts and necessities, *mutatis mutandis*, is enjoyed by the bulk of Swiss artizan families, in the German cantons of Switzerland. This is an assertion which cannot be set aside by mere *ipse dixit*. They who desire to do so, can alone ascertain its validity by personally visiting the homes of the Swiss peasants, at different hours, and in various cantons. I am not afraid to submit this statement to any one who has thus qualified himself to pronounce an opinion on the subject.”† The language of Mr. Laing, though not quite so circumstantial, is equally strong. “The peculiar feature,” he says, “in the condition

\* Report on Swiss Handloom Weavers, *passim*.

† Ibid. p. 110.

of the Swiss population—the great charm of Switzerland, next to its natural scenery, is the air of well-being, the neatness, the sense of property imprinted on the people, their dwellings, and their plots of land. The spirit of the proprietor is not to be mistaken in all that one sees.”\* Switzerland, however, notwithstanding the general happiness of her people, is not absolutely free from pauperism, a disease which would almost seem to be inherent in the constitution of manufacturing communities. But even the pauperism of Switzerland furnishes additional proof of the excellence of peasant proprietorship, for paupers are most rare where landed property is most divided, and are found in the greatest number in those districts which contain the largest estates. In the whole of the Engadine, the land belongs to the peasantry, and “in no country in Europe,” says Mr. Inglis, “will be found so few poor as in the Engadine.”† In the Valais, the land belongs to a few great proprietors, and according to Mr. Bakewell, the peasantry are among the poorest

\* Notes of a Traveller, p. 354. Mr. Macculloch is able to oppose one fact to the mass of evidence in favour of the happiness of the Swiss Peasantry. “Le Suisse,” says he, after Sir Francis d’Ivernois, “est aujourd’hui, après l’Irlandais, le peuple qui consomme le plus de pommes de terre.” The argument involved in this statement may be arranged syllogistically thus—

The Irishman eats potatoes, and the Irishman is poor ;  
But the Swiss also eats potatoes ;  
Therefore the Swiss also is poor.

† Inglis’s Switzerland, vol. i. pp. 109, 110.

in Switzerland.\* Inglis, however, assigns the "bad pre-eminence" to the canton of Berne, in which he says the greatest landowners reside, and which "*for this reason*, contains the greatest number of poor." †

The relative tendencies of large and small proprietorship to promote pauperism cannot, however, be better exemplified than by a comparison of Upper with Lower Tyrol. In the former province the inhabitants cultivate their own lands, but their properties are in general very small, not enabling them to keep more live stock than a cow and a pig or two. Inglis indeed carelessly observes, that the land of an Upper Tyrolean peasant seldom produces more than enough for the consumption of his family, and that the owner, "though in one sense independent, treading and labouring his own soil, and eating the produce of his own industry, is yet poor, and lives worse than a day-labourer in many other countries." ‡ These, however, are evidently hasty conclusions founded upon superficial observation or upon hearsay, and are directly contradicted by information subsequently obtained. Inglis one day took refuge from a storm in the house of a peasant of the class just referred to, and was invited to wait for dinner, which was almost ready. His host's estate consisted of no more than four acres, and he possessed only one cow, two

\* Travels in the Tarentaise, Switzerland, &c., vol. ii. p. 227.

† Inglis's Switzerland, vol. i. p. 223.

‡ Inglis's Tyrol, vol. i. p. 177.

pigs, and some poultry, yet the meal prepared for his family of six persons consisted of soup made of Indian corn and milk, a piece of boiled bacon five pounds in weight, a salad, bread two-thirds Indian corn and one-third wheat, butter, and wine of Botzen. This is expressly stated to have been the regular dinner of the house, except once a week, when fresh meat was substituted for the bacon. Besides the crops raised for home consumption, a good deal of wheat and barley was sent to market, and from the proceeds, after coffee, sugar, and clothes were bought, there remained a small surplus in money, which had gradually amounted to a considerable purse.\* Perhaps this may be too flattering an example of the mode of life of the Northern Tyrolese, and the food of the majority may consist only of bread, Indian corn, and milk. Still, it is certain that their diet, though simple, is both plentiful and nourishing, for a finer, more athletic race, does not exist. This shows very convincingly that they are amply supplied with mere necessities; but it must be admitted at the same time, that they have not the same command over the conveniences and luxuries of life as their Swiss neighbours. We need not stay to inquire the causes of this comparative poverty, whether it proceed from Austrian misgovernment or from a want of the mountain pastures, which, in Switzerland,

\* Inglis's Tyrol, vol. ii. pp. 3—7.

enable cattle to be kept at a trifling expense. We need only ascertain that it has no connexion with peasant proprietorship, and in order to be satisfied on that point we have only to cross the line which separates Upper or German from Lower or Italian Tyrol. "The moment we leave Botzen and travel towards Trent, a new order of things is perceptible; the same noble-looking peasantry are no longer to be seen; poverty begins to show itself, and the air of comfort about the dwellings, and independence about the inmates, are no longer visible. All the land in Southern Tyrol belongs to great proprietors, and the peasantry have no longer an interest in the soil. It seems to the traveller, at first sight, a strange inversion of what might be expected,—that in the fertile vales and finest plains in Europe, he should see so much poverty, and that, on the contrary, when he journeys among mountain regions, where excessive labour forces from the soil an unwilling crop, he perceives every appearance of comfort and ease. The condition of the people in the most fertile plains of Italy, Germany, France, or England, will bear no comparison with that of the inhabitants of the Grison valleys, or of the Oberland Bernois, or of the Upper Tyrol. But the difficulty is at once explained when we learn that the former are labourers for hire, and that the latter labour their own soil." \*

\* Inglis's Tyrol, vol. ii. pp. 100—4.

Many similar examples might be produced, but not to exhaust the reader's patience, I will, before concluding this chapter, only refer to the history and present state of the Channel Islands, respecting which I am the more desirous of mentioning a few particulars, both because they bear in a very remarkable manner on the subject under consideration, and because a recent visit to the islands has enabled me to test the accuracy of some of the statements of preceding writers. Both Guernsey and Jersey, like the rest of the Duchy of Normandy, with which they were incorporated, were once subject to feudal government. The former island was distributed by William the Conqueror amongst sixteen tenants in chief, who were not only entitled to military service from their vassals or serfs, but had their tables supplied and their lands cultivated by them, and moreover, exercised over them, "*la haute justice*," or the right of hanging on occasion. The steps by which this order of things was subverted cannot now be traced, but it is clear that the feudal system must have been deeply undermined before the charter of King John could substitute jurats, to be chosen by the people at large, for the supreme court of chevaliers who had previously exercised hereditary jurisdiction; and it further appears, from a petition presented to the Protector Cromwell, that in the seventeenth century, land in

Guernsey was held by the cultivators, on no other condition than that of paying "chief rents, homages, services, tithes, and campart," the amount of which, though sufficiently burthensome, was, and apparently had long been, fixed and invariable. Some of these feudal dues are still exacted, though, in consequence of the fall in the value of money, and of the improvement of agriculture, they constitute at present a very inconsiderable deduction from the annual produce; but, except in so far as their right to the title may be affected by this circumstance, the tillers are likewise in general owners of the soil, and have been so for at least two hundred years. The law of inheritance requires land to be divided among all the children of the last owner, daughters as well as sons, though it treats the former in general more liberally than the latter, and permits the eldest son, besides sharing equally with his brothers, to take in addition his father's principal dwelling-house, and about sixteen perches of ground adjoining it. So insignificant a concession to primogeniture cannot have sensibly impeded the partition of land, for which moreover, if any tendency to it really existed, ample time has been allowed in the course of two centuries. Is then land in Guernsey actually too minutely subdivided, and is the agricultural population redundant, and consequently poor?

When political economists speak of estates or farms as too small, they mean, either that the gross produce is less than it would otherwise be, or at least, that a smaller portion is set apart for the use of the non-agricultural classes. When they say that an agricultural class is too numerous, they mean, either that it consumes food which should be reserved for other classes, or that its own wants are inadequately supplied. We have already seen that in Guernsey, neither the partition of land nor the number of cultivators is such as to produce any injurious effect on the rest of the community, for not even in England is nearly so large a quantity of produce sent to market from a tract of such limited extent. This of itself might prove that the cultivators must be far removed above poverty, for being absolute owners of all the produce raised by them, they of course sell only what they do not themselves require. But the satisfactoriness of their condition is apparent to every observer.\* "The happiest community," says Mr. Hill,† "which it has ever been my lot to fall

\* To the previous unanimity on this point, there is at length one exception. Mr. Macculloch, in his recent treatise on Succession to Property, p. 30, characteristically mistaking a mere inference of his own for an actual fact, asserts that the people of the Channel Islands "are for the most part exceedingly poor." Any theory may be constructed when the necessary materials can be so easily created.

† Mr. Hill was formerly an inspector of schools in Scotland. His observations on Guernsey first appeared in the London Examiner, and were re-published in Tait's Magazine for June, 1834.

in with, is to be found in this little island of Guernsey." "No matter," says Sir George Head, "to what point the traveller may choose to bend his way, comfort everywhere prevails."\* What most surprises the English visitor in his first walk or drive beyond the bounds of St. Peter's Port is the appearance of the habitations with which the landscape is thickly studded. Many of them are such as in his own country would belong to persons of middle rank ; but he is puzzled to guess what sort of people live in the others, which, though in general not large enough for farmers, are almost invariably much too good in every respect for day-labourers. The walls are often completely hidden by rose-trees, geraniums, and myrtles, which reach up to the ledge of the roof, and form an arch over the door. Every window is crowded with pots of choice flowers, which are sometimes to be found also in the little front-garden, though the latter is more commonly given up to useful than to ornamental plants. Such attention to elegance about a dwelling has always been held to signify that the inmates are not absorbed by the cares of life, but have leisure and taste for its enjoyments. But beauty is not the only nor the chief recommendation of the Guernsey cottages. They are always substantially built of stone, and being generally of two stories, contain

\* Home Tour through various Parts of the United Kingdom.

plenty of accommodation. The interior is not unworthy of the exterior. In every room, pulley windows, with large squares of glass, take the place of leaded casements with diamond-shaped panes; equal attention is paid to comfort and to neatness in the fitting-up; there is abundance of all needful furniture, of crockery, and kitchen utensils; and fitches of bacon, those best ornaments of a poor man's chimney, are scarcely ever wanting. This picture is not drawn from one or two select models, but is a fair representation of the generality of the dwellings of the peasantry. Literally, in the whole island, with the exception of a few fishermen's huts, there is not one so mean as to be likened to the ordinary habitation of an English farm-labourer. This assertion will startle many who, using their prejudices instead of their eyes, still believe in the reality of what has long ceased to exist, except in tradition or fancy. The poets and romance writers who so highly extol the comfort and beauty of English cottages, are pseudo-enthusiasts, parading only simulated raptures. They themselves never beheld what they describe. Their descriptions are not indeed purely imaginative, for they are copies of pictures of old date, which, when first painted, were very possibly true to nature. The original artists lived while cottagers had a permanent interest in their tenements, and means as well as taste and leisure for adorning them. All this

has long been changed. When the cottagers were deprived of their gardens, their rights of common, and their cows, they were considerably removed from their picturesque homes to others more suitable to their altered circumstances. Hear what is said of a modern day-labourer's habitation, by one who will not be suspected of depreciating anything English. "There is his tenement of one or two rooms, his naked walls, bare brick, stone, or mud floor, a few wooden or rush-bottomed chairs, a deal or old oak table, a simple fire-place with its oven beside it, a few pots and pans—there you have his whole abode, goods, and chattels." And this is a sketch from "cottage life in its best estate, in its unsophisticated and unpauperised condition."\* Yet still, in spite of the evidence of our senses, we cling to the memory of the past, as if it were a faithful representation of the present. Admiration of the dwellings of our peasantry, is part of our national creed: we force ourselves to admire what we are told is admirable, and readily acquiesce in the assurance that our ploughmen and cowherds are very commodiously lodged. Strangers are not always so complaisant. "Look," says a late Bailiff of Guernsey, Mr. De l'Isle Brock, "at the *hovels* of the English, and compare them with the cottages of our peasantry;" and, in truth, his contempt, however strange and

\* Howitt's Rural Life of England, vol. ii. pp. 128-9.

impertinent it may sound to English ears, would be completely justified by the comparison. It is to the Channel Islands or to Switzerland that we must look, if we would see realised those pleasing poetical descriptions, the materials for which were once to be found in our own country.

The people of Guernsey are as well clad as lodged. The working dress of the men, who wear a short blue frock over their other clothes, is not indeed very becoming, but it is never ragged; and on Sundays they don a suit of broad-cloth, while their wives and daughters of course make at least an equal display of the outward symbols of respectability.

What makes the evident affluence of these islanders a still more gratifying spectacle is its almost universal diffusion. Beggars are utterly unknown, and their absence cannot be wholly accounted for by the interdict enacted against them; for in England, where their profession is equally illegal, not a day passes without your meeting several, whereas in the Channel Islands not one is ever seen. Pauperism, able-bodied pauperism at least, is nearly as rare as mendicancy. There are two so-called "hospitals" in Guernsey, one for the town and the other for the country parishes, which, in addition to the purpose indicated by their names, serve also as poor-houses and houses of industry; yet the inmates of all descriptions in the Town

Hospital, at the time of my visit, were only eighty men, one hundred and thirty women, fifty-five boys, and thirty-nine girls, and I was assured that every one of the adults was incapacitated from earning a livelihood by some mental or bodily defect, or by bad character. No one fit for employment had been compelled to take refuge there by inability to procure work. The same remark applies to the Country Hospital, in which I found eighteen men able to work, but who were either habitual drunkards or otherwise of such bad character that no one would employ them. The average number of inmates, of both sexes and of all ages and classes, is one hundred and forty-six. The Savings Banks' Accounts also bear witness to the general abundance enjoyed by the labouring classes of Guernsey. In the year 1841 there were in England, out of a population of nearly fifteen millions, less than 700,000 depositors, or one in every twenty persons, and the average amount of the deposits was 30*l*. In Guernsey, in the same year, out of a population of 26,000, the number of depositors was 1920, and the average amount of the deposits 40*l*. Being exempt from poverty themselves, the Channel Islanders are foremost in their contributions to the relief of misery in less favoured lands. In the year 1822 the inhabitants of St. Peter's Port raised by subscriptions about 700*l*. for the relief of their famishing brethren in the west of Ireland, and

in 1831, 600*l.* were raised for the same purpose in Guernsey and Alderney; upon which occasion an Irish newspaper, while gratefully acknowledging the contributions received from England, felt "bound especially to notice the *transcendent* liberality of Guernsey." That island had, in proportion to its extent, done more on behalf of the famishing poor of Mayo than any other place from which relief had been furnished.\*

It is especially deserving of notice, that the prosperity of Guernsey is not only great, but has long been steadily advancing; in other words, that the progress of population has been less rapid than the progress of wealth. In the year 1615 the number of houses in the island was 1355; in the year 1821 it was 3032, from which it may be inferred that the number of inhabitants had doubled in about 180 years. In 1797 the total population was 15,500, and in 1836 had risen to 24,500. But in the petition presented to Cromwell soon after the close of the civil war, it is stated that only one-twentieth of the inhabitants had any substance; that only two or three persons had 200*l.* a year, not ten 100*l.*, and not thirty 50*l.* a year;† whereas, in 1797, the annual income of the island was assessed for the purpose of taxation at 97,691*l.*, or 6*l.* 6*s.* per head; and in the

\* Duncan's History of Guernsey, p. 304.

† Ibid. p. 100.

year 1836 at 212,440*l.*, or 8*l.* 13*s.* per head. Thus, in thirty-nine years population had increased fifty-eight percent., while wealth had increased one hundred and seventeen per cent. It should be added, that the largest augmentation of property had taken place in the country parishes, while two-thirds of the increased number of inhabitants belonged to the town; and it moreover seems probable that the increase of population, both in town and country, was produced principally by immigration, for at the census of 1841 the number of inhabitants not natives was not less than 6517, equal to the whole addition made to the population since the year 1818, when settlers from Great Britain first began to resort to the Channel Islands. If no other example could be given, this alone might be accepted as a decisive proof that peasant proprietorship has no tendency to create a redundant and poor agrarian population, but is rather calculated to make each succeeding generation wealthier than that which immediately preceded it.

The general resemblance between Jersey and Guernsey renders it unnecessary to enter into much detail respecting the former. Land there has not been so much divided as in the sister island, owing to the influence of a law of inheritance, which might be advantageously adopted in the latter, and which permits the eldest son to take the principal dwelling-

house and thirty perches of ground adjoining, besides sharing equally with his brothers in the rest of the property, and, moreover, allots to him the whole of the estate if it do not exceed four verges. As the estates of the peasantry are larger than in Guernsey, so also are their dwellings,—a much greater proportion of which are of sufficient size to deserve to be styled farm-houses. Some of them, indeed, have so much architectural pretension that they might almost be mistaken for the residences of independent gentlemen, if the fields of corn, parsnips, or cabbages, lying close under the parlour-windows, did not show that they really belong to farmers. On the other hand, the mere cottages are very inferior in outward appearance to those of Guernsey, being commonly built of rough stone, and sometimes apparently without cement. Their inferiority, however, is probably only external, for, though I did not myself enter any of them, the well-dressed people whom I saw leaving them on Sunday were evidently not prevented by want of means from making themselves comfortable. The antiquity of the cottages may probably afford an explanation of their uninviting appearance, for most of them seem to have been built one or two centuries ago, when every peasant was perhaps his own mason, and not very deeply skilled in the art. All recent buildings, and all new additions to old ones, are in a very much

better style. Mendicancy and pauperism are at present as rare as in Guernsey, and the improvement which time has wrought in the condition of the people is still more remarkable. Dr. Heylin, who accompanied the Earl of Danby to the Channel Islands, in the year 1629, and who says, that in Guernsey he "did not see one beggar," describes the Jersey men, as "more poor, and therefore more destitute of humanity," and their children as "continually craving alms of every stranger," whereas at present some tact would be requisite to prevent any of them from being affronted by an offer of money. Jersey seems to have been very thickly peopled at a pretty early period. Heylin, in the middle of the seventeenth century, speaks already of the "multitudes of people," whom he estimates, though very extravagantly, at 30,000; but there are good grounds for supposing that, in 1734, their number was as high as 20,000. During the next seventy years population made little progress, for at the census taken in 1806, it was found to be only 22,855, but it has since advanced rapidly, having reached to 36,582 in 1831, and to 47,544 in 1841. As in Guernsey, however, by far the greater part of the additional number of inhabitants reside in the town. From the map prefixed to Falle's History, it appears that, in the year 1734, there were 354 houses in the parish of St. Helier's, and 2594 in the eleven

country parishes. In 1831, St. Helier's contained 1917 houses, or one for every 8·5 inhabitants, and the country parishes contained 3073 houses, or one for every 6·7 inhabitants; so that in the interval between 1734 and 1831, the population of the town would appear to have been more than quintupled, while that of the country had increased only 17 per cent.

Notwithstanding the great and increasing prosperity of Jersey, there are some even among the inhabitants, sufficiently modest to prefer the ingenious fancies of theorists to the realities of their own observation; who imagine they can see in the division of land the symptoms of approaching pauperism. Thus Colonel Le Couteur declares that "the too minute subdivision which takes place, frequently drives several branches of a family to beggary; and the elder branch, by being deprived of too considerable a portion of the land, instead of being able to carry on improvements, purchase manure, or work the land properly, can scarcely extract a miserable subsistence from his estate."\* Col. Le Couteur's authority is deservedly very high, yet, in answer to the opinion thus expressed by him, it may be sufficient to quote a parallel passage from Falle, who more than a century earlier was tormented by the

\* Agricultural Survey of Jersey, in *Guernsey and Jersey Magazine* for July, 1838, pp. 238-9.

same groundless apprehensions. "The custom of gavelkind," says that reverend historian, "destroys many fine inheritances by dividing them into so many small portions, which are again subdivided in the following generation, and so on progressively, till the parts of the inheritance are reduced almost to nothing."\* Since Falle wrote, the peasantry have grown richer instead of becoming continually more impoverished, but though they should continue to advance in the same manner for another hundred years, some one will still be found to take the same gloomy view as the writers just quoted, drawing, like them, his conclusion from a few exceptional cases of minute partition, without noticing how their effects are counterbalanced by other instances of consolidation.

I only refer to Alderney in order to notice a misrepresentation of the late Mr. Inglis, which, if suffered to remain uncontradicted, might be cited in support of one of the gravest charges against peasant proprietorship. "The appearance of the cultivated district," he says, "is singular, owing to the very minute properties, and the odd way in which the proprietors have sown their crops. It is all laid out in narrow strips of different sorts of grain, and in

\* Falle's History of Jersey, chap. ii. Not having the original work at hand, I have extracted the passage in the text from a French translation.

lucerne, potatoes, clover, &c. These all lie in different directions, straight across and transversely, and to so great an extent has the division of property descended, that, in looking at a proprietor ploughing his strip, it is difficult to see how he will find room to turn his plough."\* This strange mis-statement, for which there is scarcely a tittle of foundation, can only be explained by the shortness of Mr. Inglis's visit to Alderney, which I was informed on the spot, did not much exceed twenty-four hours. The actual aspect of Alderney is sufficiently curious to render exaggeration or distortion of its features altogether superfluous. The dwellings of the cultivators are not scattered over the face of the island, but are collected together on a spot about a mile from the beach, forming a little metropolis of three or four streets, in which all the peasantry, with the exception of some half-dozen families, reside. Close to the town is a plain of some extent, the original territory of the rustic citizens, and between it and the sea is a belt of what until recently was common land, but which, in the year 1830, was divided equally among all the resident inhabitants. Many of the allotments on this external belt are separated from each other by stone walls; but the central plain adjoining the town is perfectly open, without a tree, a bush, or a fence of any kind upon it, and is divided into strips, not however too narrow

\* Inglis's Channel Islands, vol. ii. p. 162.

to prevent a plough from turning, but varying in width from three to twenty yards, and in length from one hundred to several hundred yards. Here and there may certainly be seen a patch of potatoes or parsnips, of perhaps only a few square yards, but on inquiry it will invariably be found to belong either to the proprietor of other land, or to a shop-keeper, to whom it serves as a kitchen-garden. Of the larger strips, each belongs to one person, but does not necessarily constitute the whole of his property, for he may, and almost always does, possess one or more pieces of ground situated elsewhere. Compactness is a quality possessed by few estates, most of them consisting of scattered members lying far apart. This disjointedness seems to result from the absence of inclosures, and from the complete separation of the houses from their respective portions of land. The owner of a cottage situated amidst its own ground, would, on becoming possessed by marriage or inheritance of a detached field, endeavour to exchange it for one nearer his place of abode, more especially if he would otherwise be required to make a fence to mark the bounds of his new acquisition. But an Alderney-man, whose property lies perfectly open, and who must walk some distance from home before he can reach any part of it, has not the same motive for wishing to see the whole brought near together. The inconvenience arising from the

dispersion of its several portions, is not sufficient to induce him to run the risk of being over-reached in a bargain. Although separately small, the landed possessions of an Alderney-man are quite sufficient, when united, for his maintenance. In fact, although *land* may be more minutely divided than in the other islands, the properties of the peasants, if by property be understood all the land belonging to one man, are considerably larger, and the proprietors live proportionably better. Considering their station, they may even be called affluent. Their houses, being arranged in rows, have no picturesqueness, but what is wanting in beauty is amply compensated in more important respects. They are too large to be termed cottages, being almost invariably two-storied erections equal in external appearance to the dwellings of shopkeepers in English villages, and the rooms are furnished with carpets, sofas, and other articles equally rare in a husbandman's abode. Their dress and diet correspond with the style of their habitations, all their habits being marked rather by profuseness than by the parsimony characteristic of the same class in the neighbouring islands. It is only fair to add, that their means of indulging in so much larger expenditure are not derived entirely from agriculture, but arise in great part from the profits of contraband trade, which was at one time very actively carried on by them. But to whatever

cause attributable, the ease and abundance in which they live are, at least, sufficient to show that Alderney is the last place in which to seek for the poverty which peasant proprietorship is said to engender.\*

\* For many of the particulars relative to Alderney, I am indebted to the kindness of Mr. Gaudion, Judge of that island. I may take this opportunity to acknowledge my obligations to several gentlemen of Guernsey for the information which they either afforded me or assisted me to procure. My thanks are especially due to Mr. Carey, of Castle Carey; Dr. Hoskins; Mr. Edgar Macculloch, one of the Jurats of the Royal Court; and Mr. N. Le Beir, Secretary of the Guernsey Agricultural Society.

## CHAPTER III.

## EFFECTS OF PEASANT PROPRIETORSHIP IN FRANCE.

It may have been thought not a little extraordinary, that of the examples hitherto cited in support of the arguments used in the preceding chapters, scarcely any have been taken from France, a country which, as abounding more than any other in peasant proprietors, might seem deserving of especial reference. The reason for the omission was, that the evidence with respect to France is sufficiently ambiguous and inconsistent, to have led different reasoners to directly opposite conclusions. If the advocates of peasant proprietorship imagine that it furnishes fresh 'proofs of the correctness of their views, their opponents appeal to it with not less confidence, as affording a practical illustration of the soundness of their theory. The difference of opinion does not merely regard the inferences to be drawn from admitted facts; the facts themselves are disputed; and while their real character remains doubtful, no one can be expected to be convinced by them. It would have been mere trifling to have attempted to

deduce anything from the condition of the French peasantry, until it had been settled what that condition is by a cross-examination of the evidence on the subject; and it was thought more convenient to reserve that operation for a separate chapter.

It should be premised, that it is an error to suppose that peasant proprietorship in France dates only from the Revolution. As in other parts of Europe, it probably grew out of the decay of feudalism, and may have been in existence for several centuries; but at any rate it had become very general much earlier than is commonly imagined, for in the years 1787, 8 and 9, while the danger impending over the crown and nobility was suspected by few, Arthur Young found reason for supposing that one third of the kingdom was occupied by peasant properties.\* It must be confessed that the picture which Young draws of these little estates, is far from flattering. He speaks enthusiastically of the industry he observed upon them, but there his eulogy ends. Their cultivation he describes as "execrable." So it was indeed generally throughout France, on farms of all sizes; but Young declares, that he "never saw a single instance of good husbandry on a small farm, except on soils of the greatest fertility," such for example as that of Flanders, where, however, it does not appear to have occurred to him, that the fertility

\* Travels in France, vol. i. p. 412.

he admired was the effect of the good husbandry of which he supposed it to be the cause. The social position of the small proprietors he describes as corresponding with their agricultural skill. In Flanders, Alsace, on the Garonne and in Bearn, he found many in comfortable circumstances, and in Bas Bretagne he heard that many were reputed rich ; but in general, he says, they were poor and miserable, owing, in a great measure, to the equal division of land among all the children of a deceased owner. Young's honesty is unimpeachable: what he represents as having come under his own observation, he doubtless either saw, or fancied he saw. Appearances may sometimes have deceived him, but with a few unimportant deductions, his description may be accepted as substantially correct, and we may believe, upon his assurance, that French peasant proprietors were in his day ignorant, unskilful, and miserably poor.

A condition, however, so opposite to that of persons of the same class in other countries, cannot have arisen from the proprietary character common to all, but rather from some circumstances peculiar to France; and Young himself unconsciously informs us what the peculiarities were. The fiscal and feudal oppression under which the peasantry groaned, would be sufficient of itself to account for their depression. Among other grievous taxes were those on land, and on the profits of farming, to which

they alone were subject, the clergy and gentry being exempt. These taxes, besides being very onerous, were not even of fixed amount. The rates were altered from year to year, at the discretion of the intendants and their deputies, who, in assessing districts or parishes, professed to be guided by the appearance of the crops, and in assessing individuals, by the stock upon their farms. It was the interest, therefore, of every farmer, to appear to have as little stock as possible, and consequently to employ as little as possible in its cultivation, and none in its improvement.\* The game laws were still more outrageous than those respecting the collection of the revenue. There were numerous edicts which prohibited weeding and hoeing, lest the young partridges should be disturbed; steeping seed, lest it should injure their health; manuring with night soil, lest their flavour should be spoilt by their feeding on the corn so treated; mowing hay before a certain time, or removing stubble, lest the birds should be deprived of shelter.† Add to this, the forced labour imposed by government, and the fines and services arbitrarily exacted by lords of manors, and it need not again be asked why the French peasantry, even such of them as cultivated their own lands, were, in every sense of the term, miserable farmers. The

\* *Wealth of Nations*. Macculloch's Edit. vol. ii. p. 196.

† *Young's Travels in France*, vol. i. p. 600.

only wonder is that their industry could survive amongst circumstances of such discouragement. From the same causes proceeded, indirectly, that minute division of land so frequently remarked by Young, and which had been carried so far, that in more than one instance "a single fruit tree standing in about ten perches of ground constituted a farm, and the local situation of the family was decided by the possession."\* At the time of Young's visit, France was greatly over-peopled in the only sense in which that phrase is ever appropriate; that is to say, the supply of labourers greatly exceeded the demand. The misery to which the peasantry had been reduced, had had the usual effect of increasing their numbers. "The swarms of people were incredible."† The inheritor of a scrap of ground had scarcely any alternative but to attempt to subsist upon its produce. To sell it would in general have been to deprive himself of his only means of livelihood; for he could not hope to obtain employment as a hired labourer. It is very probable, then, that the sons of a peasant proprietor did commonly divide his farm amongst them, and that each settled down on his separate portion. Very probably too, although a man's property might be barely sufficient for his own support, he might take a wife to participate in his indigence. Why not? The usual dissuasive from

\* Travels in France, vol. i. p. 402.

† Ibid. p. 404.

such a step could not influence him. If he had been brought up in the enjoyment of something like competence, he would have feared to lose the advantages he had been accustomed to ; but having been early habituated to want and wretchedness, he would have no dread of their continuance. There seems no reason to doubt, that in France, under the old government, peasant proprietorship was attended by all these evils ; but it is not on that account to be condemned. All that its advocates contend for is, that peasant properties, sufficiently large when created to afford their owners a competent maintenance, will preserve the same average size for an indefinite period ; but it is not denied that peasant proprietors are affected by misery in the same manner as other men, or that when reduced to poverty by wicked laws, poverty will extinguish in them the virtue of prudence.

Peasant proprietorship did not obtain a fair trial in France, until the worst abuses of tyranny and feudalism were swept away at the Revolution, and its history since that period is consequently deserving of especial attention. The evil with which Young imagined it to be fraught, was attributed by that writer to the practice of the partition of an estate among all the deceased owner's children, and he strongly urged the enactment of a law placing certain restrictions on the division of land. Without

such a law, he imagined that the most dreadful consequences must inevitably ensue, and that the populousness of France would eventually "exceed the populousness of China, where," he says, "the putrid carcasses of dogs, cats, rats, and every species of filth and vermin are sought with avidity to maintain the life of wretches born only to be starved." It need not be said that no such law has been passed, but that, on the contrary, what was before a custom has now become an obligation, and that one-half at least of all property, whether real or personal, must, on the owner's death, be equally divided among his children. Moreover, to the large body of peasant proprietors who previously occupied one-third of the kingdom, were added in the course of the Revolution one million two hundred and twenty-two thousand more, among whom were divided the forfeited lands of the clergy, of corporations, and of emigrants.\* Let us inquire then what effect time has wrought in the condition of these small proprietors, and whether the lapse of nearly half a century has brought them any nearer to the dismal fate which we are assured is awaiting them.

For the last thirty years a succession of witnesses have been asserting Young's prediction to be in course of fulfilment. The Duc de la Rochefoucault, on revisiting, after the Restoration, what had once

\* Mounier. *De l'Agriculture en France*, vol. i. p. 78.

been his estate of Liancourt, found it parcelled out into a number of properties, most of which, he says, occupied less than two-thirds of an acre; and he adds, that these properties, small as they were, were always subdivided by the heirs of the last owners. M. de Bonald represents the *morcellement*,—the piece-mealing—of the land in the south of France, as proceeding in a geometrical ratio. He describes a farm as divided first among all the last owner's children, and at the end of a second generation among as many sets of his grand-children, every one of whom is so much attached to his little fragment of patrimony, that he would work the flesh off his bones in striving to procure a wretched subsistence from it, rather than resort to a profession in which he might earn a more abundant livelihood with less trouble. M. Rainneville, in the north of the kingdom, alludes with more eloquence than perspicuity, to the "division whose fatal action devours the soil of the fields with afflicting rapidity." M. Bosc declares that he has noticed in Lorraine, numbers of fields only four yards long by two broad, reduced to that size by the passion of coheirs for dividing every piece of ground, however small. Mr. Birkbeck speaks of the country people as "poor from generation to generation, and growing continually poorer as they increase in numbers by the division and subdivision of property;" and M. Lafitte asserts that a considerable portion of them

eat neither bread nor meat, but feed solely on coarse roots, and have no other covering but rags.\* Finally, Messrs. Mounier and Rubichon assert the great body of the peasantry to be on the brink of starvation, and this opinion having been adopted by a smart writer in the most dignified of English periodical works, has been accepted as an article of faith by that numerous and very respectable class of readers who reverence the "Quarterly Review," as a periodical revelation.†

Happily it is not necessary to put every one of these witnesses to the question. All, save the last two, profess to describe the state of affairs previously to the year 1827; Messrs. Mounier and Rubichon alone, whose book was published in 1846, treat of things as they are, and we may therefore confine our scrutiny to them and to their English expounder. These have given us not only their opinions, but also the statistical reports and tables upon which those opinions are founded, and have thus furnished

\* The statements of the several writers quoted may be found more at length in Mr. Macculloch's edition of the *Wealth of Nations*, vol. iv. pp. 466—470.

† Quarterly Review, No. 157, Art. 7. The reviewer was answered, immediately after the appearance of his essay, by a series of articles in the *Morning Chronicle*, by Mr. John S. Mill, who has reprinted them in his Appendix to his *Principles of Political Economy*. In these masterly papers, Mr. Mill will be found to have anticipated many of the remarks in the text, and he has, moreover, discussed, at considerable length, some matters to which my plan required only a slight reference.

us with the means of testing the soundness of their judgment. Their representations, as they may prove to be true or false, will confirm or refute the statements of their predecessors. According to the latter, the division of land had not only been carried too far, but was proceeding with accelerated speed ; the agricultural population was daily becoming more numerous and poor. To prove that their reasonings were false, it will be sufficient to show that since they wrote, things have not become worse ; that land is not more divided, nor pauperism more general. If it shall, moreover, appear that during the interval the average size of estates has increased instead of diminishing, or that instead of deterioration, a very sensible improvement has taken place in the condition of the peasantry, their refutation will be still more complete. But in either case it will be evident either that they were misled by superficial observation, or that they began to theorise without having first laid a sufficient foundation of facts.

France, in 1835, contained 33,326,573 inhabitants, composing about seven millions of families, of whom, according to M. Mounier, nearly five millions and a half (5,446,763) were families of landed proprietors. This last statement, however, is nothing more than a guess, for nothing certain is known on the subject. What is known is the number of properties assessed to the land-tax, which in the same year was

10,893,528, or almost exactly double the supposed number of proprietors. All the lands or buildings possessed by the same person in one commune, are assessed as a distinct property; but many persons possess many such properties in different communes. It has been assumed, that on an average, every proprietor possesses two, and in order to obtain the number of proprietors, the whole number of properties assessed has been divided by two. A result so obtained is evidently worth nothing, and it is accordingly disregarded by M. Mounier's own coadjutor, M. Rubichon, who is content to reckon the proprietary families at four millions, and the whole number of agricultural families at 5,200,000, or at three-fourths of the entire population.\* That the second of these estimates, although so much reduced, is yet far beyond the truth, will instantly appear, on reference to the statistical tables of houses, of which very considerably more than one-fourth are situated in towns containing not less than 1,500 inhabitants,† so that if every resident in towns of smaller size, and in the rest of the country, were engaged in husbandry, the number of agricultural families would still be much less than M. Rubichon imagines. Even if his estimate were correct, and if the

\* De l'Agric. en France, tom. i. p. 117. See also p. 266.

† Systèmes de Culture, par M. Hippolyte Passy—a work calculated to exalt the reputation even of that eminent statesman,—p. 163.

inhabitants of the rural districts were really thrice as numerous as those of towns, the proportion of the rural to the whole population would be found to have diminished within the last sixty years; for, in 1793, the inhabitants of the towns were 5,709,270; while those of the country were 20,521,538, or much more nearly four times than three times as numerous as the former.\*

It is obvious, however, that notwithstanding this change in the proportion between the agricultural and other classes, the absolute number both of agriculturists and of landed proprietors may have greatly increased; and those who maintain that this is really the case, are able to point to one fact, which at first seems strongly to favour their conclusion. This is the great increase which has taken place in the number of *cotes foncières*, or properties assessed to the land-tax. In the year 1815, the number was 10,083,751; in 1826, 10,296,693; and in 1835, 10,893,528. Thus, in the interval between 1815 and 1826, there was an annual increase of 21,294, and in the next

\* Arthur Young's Travels in France, vol. i. p. 479. One reason why the agricultural population has been so much over-rated is, that all the proprietors are commonly counted as cultivators (Macculloch, Geog. Dict., vol. i. p. 853); whereas, according to Chateaufieux, only 50,000,000 acres, or considerably less than one-half of the cultivated land are cultivated by the owners, the rest being held by tenant-farmers. Another circumstance deserving of notice is, that as the same tenant often holds of several proprietors, the number of estates must much exceed the number of farms.

decennial period an annual increase of 59,683; so that the number has not only been continually advancing, but has advanced with continually increasing rapidity. It further appears, that in the eleven years ending with 1826, the increase took place among the properties most lightly taxed, while the number of properties paying as much as one-thousand francs fell off considerably; and it has thence been not unnaturally inferred, that the multiplication of the smaller properties was the effect of the division of large ones. M. Passy has, however, furnished us with a more satisfactory explanation of the phenomenon. Among other ways and means of meeting the extraordinary expences of the year 1815, was an addition to the land-tax, which caused most estates to be placed in the register in the class above that to which they had previously belonged. When the war taxes were removed, the old rates of assessment were resumed, and from the highest class of all, consisting of estates rated at one thousand francs and upwards, more than four thousand were withdrawn to be placed in the class immediately below. As a proof that this was the true cause of the reduction of the highest class, it may be mentioned that since 1826, and more particularly since 1835, the number of estates of every class, without exception, has increased, and that the increase has been greatest in the highest class. Between 1835 and 1842, the

estates rated at 1000 francs and upwards, increased in number 22·4 per cent.

Those rated at from 500 to 1000 frs. increased 11 per cent.

”	”	100 to 500	”	10·3	”
”	”	50 to 100	”	9·8	”
”	”	30 to 50	”	8·8	”
”	”	20 to 30	”	7·4	”
”	”	10 to 20	”	6·6	”
”	”	5 to 10	”	3·2	”
”	”	below 5	”	4·5	”

Now if it were the subdivision of estates which had occasioned the augmentation of their number, what one class had gained another must have lost; but as an increase has taken place in every class without exception, it must evidently have proceeded from other causes. The information supplied by M. Passy enables us to discover what those causes were. Among the *cotes foncières* are included houses and all other buildings, of which, between 1826 and 1835, there were placed on the register 321,226, which were either newly constructed, or had been omitted in former assessments; and of these, M. Passy reckons that three-fifths have little or no ground attached to them beyond the sites on which they stand. The construction of such buildings increased the number of *cotes foncières* without occasioning any perceptible partition of cultivable land.\*

\* Passy. *Systèmes de Culture*, pp. 162-170.

During the same period, crown lands to the value of nearly five millions and a half sterling were sold,\* and communal lands of unascertained extent were divided. Add to the effects of these operations the permanent division of house property in towns by coheirs, and it will be easy to understand how the whole increase in the number of *cotes foncières* may have taken place without any sensible diminution in the size of landed estates. M. Passy mentions some other facts, which are too significant to be omitted. For some years past, a new survey and valuation of land has been in progress in France, and in thirty-seven cantons scattered throughout the kingdom, the operation has been completed. At the previous survey in 1810, there were in these cantons 154,266 *cotes foncières*. There are now 163,277, the difference being equal to an increase of five per cent., while the population has increased at the rate of 19 per cent. But not only do the *cotes foncières*, at present, bear a smaller proportion to the mass of inhabitants than at the date of the last survey: the small addition which has been made to their number may be accounted for entirely by the progress of building. The number of *cotes foncières* is, at present, greater by 9011 than in 1810; but in the same interval, an addition has

\* Mounier. De l'Agric. en France, tom. i. p. 110.

been made to the population of 120,000, for whom, at least 22,000 new houses must have been built.\* If we suppose that these new houses have led to the creation of less than one half the same number of *cotes foncières*, they may still suffice to convince us that landed property, properly so called, is not at present divided among a greater number of owners than it was thirty-seven years ago.

But although the partition of landed property ceased long ago to make any sensible progress, it may perhaps have advanced too far before its course was stopped. Estates may already be too minutely divided: the majority of proprietors may not possess land enough for their proper maintenance, and if destitute of any other means of livelihood, may be pining in extreme indigence. That such is actually the situation of the great mass of the French peasantry, is unhesitatingly affirmed by Messrs. Mounier and Rubichon, and by their English follower, who, in their attempts to justify their assertion, affect an arithmetical precision which is amusingly contrasted with their real bewilderment. There are 10,893,528 *cotes foncières*, or rated properties, and there are supposed to be about half this number, or 5,446,763 distinct proprietors. So says the Quarterly Reviewer, yet in the very next sentence he forgets the distinction

\* Passy, *ut supra*, pp. 171, 174.

he had just drawn between properties and proprietors, and finding that of the former there are 5,163,000 rated at less than five francs, he imagines that there must be the same number of persons taxed equally lightly; and he adds, that as the French land-tax is on an average equal to tenpence the English acre, there must be upwards of five millions of proprietors whose average holdings are under five acres.\* The conclusion to which his own premises should have brought him is, that the very poorest class of proprietors consists not of five millions, but of two millions and a-half, rated, not at five, but at ten francs, and possessing on an average, not five, but ten acres. The credit of this blunder belongs exclusively to the Reviewer himself: into the next he only follows his leader. M. Mounier informs us that there are 2,602,705 proprietary families whose income is supposed not to exceed fifty francs, whereupon the Reviewer, having first generously increased by one half the supposed income, cannot suppress his astonishment and scorn at the idea of 2,600,000 families, (families of proprietors too!) having but sixty shillings a year to live upon; and he protests that the "poorest day-labourer would earn four times as much."† A writer who can put forth such stuff as this must either be very dull himself, or must count upon an

\* Quarterly Review, No. 157, pp. 211, 216.

† Quarterly Review, No. 157, p. 210.

extraordinary share of dulness in his readers. The Reviewer might have known or guessed that the value of the produce of five acres must be rather more than sixty shillings, but both he and Mounier confound the rent for which land might be let, with its gross produce, and imagine that a peasant proprietor receives only rent. They forget that he unites in his own person the characters of landlord, tenant, and labourer, and takes for his own use the shares of all three, or the entire produce of his fields. If the great body of the peasantry cannot subsist in comfort, although holding their lands on such terms, their inability must proceed from some other cause than the smallness of their holdings. Mounier's own figures, rightly understood, assign to the very poorest class of proprietors an average approaching nearer to ten than to five acres; and a much better authority, M. de Chateaufieux, estimates the average holdings of the 3,900,000 poorer proprietors at eight acres and a half.\* French agriculture is confessedly very defective, but unless a French peasant obtains less from an acre than English allotment holders from a rood, the owner of eight acres and a half must, at the very least, have an income of 40*l.*, instead of forty or sixty shillings. It is true that as eight acres and a half are the *average* extent

\* Mounier, *ut supra*, tom. i. p. 265.

of the smallest class of properties, many must be larger, and very many smaller; some perhaps not exceeding an acre or half an acre, or possibly a few square yards. There are many cottage gardens in England of no greater size; why not also in France? and why should the French, any more than the English cottager, be supposed capable of subsisting upon the produce of such a scrap of ground? Why should not he also be a day-labourer, depending upon wages for the chief part of his subsistence? The Quarterly Reviewer imagines that no one would employ him, for that the generality of his neighbours are in the same condition as himself, each tilling his own allotment, and instead of hiring extra labour, wishing himself to be hired. Indeed! let us turn again to the tables of M. Mounier. The cultivable land of France is 114,000,000 acres. The *cotes foncières* of less than five francs are 5,163,494, supposed to represent just half that number, or 2,581,747 of united properties of less than ten acres each. Their aggregate area can scarcely be more than 22,000,000 of acres, leaving 92,000,000, of acres belonging to larger proprietors, and divided into farms, of which if the average size be as low as thirty acres, there must be more than three millions. Suppose that one half of the poorest class of proprietors are not fully employed on their own lands, and must seek additional occupation elsewhere; it

will be hard if they cannot obtain it, when for every person occasionally requiring work, there are more than two farms occasionally requiring labourers. If we prefer the calculations of M. de Chateaufieux, we shall have 3,900,000 proprietors of eight and a-half acres each, and of a total area of about 33,000,000 of acres, leaving about 81,000,000 of acres to be divided into 2,700,000 farms of thirty acres. Even then, supposing one half of the poorer proprietors to be insufficiently employed at home, there would, for every two persons requiring work, be three farms on which they might obtain it.

That the condition of the French peasantry, whether proprietors or field labourers, if not yet perfectly satisfactory, has been steadily improving for many years past, is evident from the testimony of all who have themselves examined it. The opposite opinion is maintained by those only who have made their researches in books, instead of amongst the people. The Quarterly Reviewer considers it quite certain that the small landholders are in great distress, because in the ten years ending with 1835, about one-fourth part of the whole landed property of the country was sold, whereas sales of land are really the most obvious and effectual means of counteracting the evil tendency of the French law of succession. During the same ten years, a fourth-part of the land likewise passed into new hands by

inheritance or gift, the new owners being of course in the first instance much more numerous than those whom they succeeded. Most of their shares were only fractions of the estates of their predecessors, and being too small to afford them what they considered a suitable livelihood, were sold and annexed to other properties. Yet these sales, which prevented the further *morcellement* of land, and the enlargement and consequent impoverishment of the agricultural class—these very sales are declared to be signs of the poverty which they really prevented. A similar construction is placed, without much more reason, on the extent to which landed property is mortgaged, the interest payable in consequence being equal to one-third of the estimated rental of the kingdom. This would be a startling fact if the proprietors had become so deeply indebted from the difference between their ordinary income and their ordinary expenditure. It would then be obvious that their resources had not been sufficient for their permanent support, and that in order to provide for immediate necessities, they had been compelled to make use of their capital, and so to ruin their prospects for the future. But the Reviewer himself admits, though he does not see the importance of his admission, that the debts were incurred before the debtors became proprietors, or rather in order to enable them to become proprietors. A large proportion

of the land-owners obtained their property by purchase, and their debts are a part of the purchase-money still remaining unpaid. In this there is not the smallest ground for uneasiness. In France, as in other countries abounding with small estates, it is usual for a person who cannot afford to buy a piece of ground outright, to buy a certain interest in it, leaving it still charged with an annual payment to the last owner, until by industry and thrift he shall have saved enough to free it from all incumbrances. Until that time arrives, he in fact holds his land by payment of a fixed rent, the very best possible tenure by which he could hold it, except that of an unembarrassed proprietor. The French mortgagees are, for the most part, tenants of this description, paying on an average, interest or rent, whichever it may be called, at the rate of four shillings an acre, which, being no more than an English farmer commonly pays for poor's rates, can scarcely be deemed sufficient to reduce a French peasant to pauperism.

Again, Messrs. Mounier and Rubichon poring over rows of figures, and comparing the amount of agricultural produce of the whole kingdom with the number of inhabitants, believe they have ascertained that a Frenchman's daily average allowance of food is rather less than two ounces of meat and fifteen ounces of bread or its equivalents; and, without being stopped for a moment by the marvellousness of

this result, jump to the conclusion that their own nation is the worst fed in Europe. Very different was the opinion of the aged cultivators and workmen consulted by M. Clement in different places, all of whom, without a single exception, agreed that the classes of the population who have only their wages, and are consequently the most exposed to indigence, are now much better fed, lodged, and clothed, than at the commencement of the century.\* Very different is the language of one who had traversed great part of the Continent on foot, and whose evidence is the more valuable, because having no favourite theory to support, and being little more than a keen and shrewd observer, his impressions were always perfectly unbiassed. "With a tolerably intimate knowledge," says Mr. Inglis, "and distinct recollection of the lower orders of France, I am inclined to assert that, upon the whole, the French peasantry are the happiest of any country in Europe."† While passing through Languedoc, Inglis particularly remarked the "very enviable situation" of the labouring class. Upon every estate large enough to require them he found one or more small separate houses, in each of which two or three farm servants were accommodated. These people had commonly a garden and a bit of land for Indian corn, and were supplied by

\* *Recherches sur l'Indigence*, par A. Clement, pp. 84, 85.

† *Switzerland and South of France*, vol. ii. p. 269.

their master with as much bacon and wine as they required, besides receiving enough of wages for clothes, &c. A day labourer received two francs. The people appeared to be well off, and paupers were rare. He did not see one *miserable* between Carcassonne and Toulouse.\* No special allusion is here made to small proprietors; but in a district in which they are intermixed with hired labourers, their condition is always the best of the two. The peasantry are observed to be most prosperous in those parts of France in which the largest proportion of them are proprietors. Mr. Henry Bulwer remarks that by far the greatest number of indigent is to be found in the northern departments, where land is less divided than elsewhere, and cultivated with larger capitals.† Mr. Birkbeck, noticing that on the road from St. Pierre to Moulins, "the lower classes appeared less comfortable," found on inquiry that "few of the peasantry thereabouts were proprietors."‡ Mr. Le Quesne, who, when asking the causes of the smiling productiveness of Anjou and Touraine, received for answer that the land was divided into small parcels, noticed that the houses of the country people there were remarkable for their neatness, and indicative of the ease and comfort of their possessor. They are

\* Switzerland and South of France, vol. ii. p. 80.

† Monarchy of the Middle Classes, vol. ii. p. 107.

‡ Birkbeck's Tour in France, p. 30.

built, he says, of fine white stone, and besides being more numerous, are far superior in appearance to those of Normandy, where estates are larger, and where the labourers on those estates commonly live in miserable mud cottages, with heaps of dung and filth in front.\* Yet even in the districts in which small properties so much abound, there would seem to be no lack of larger farms to afford work to such cottagers as are not fully employed at home. Inglis, in his walks through Touraine, was overtaken by a countryman who said that he had land enough of his own to supply him with bread, and to enable him to keep a cow and a couple of pigs, and that he was accustomed to earn in addition from twenty-five to thirty sous a day by working for others. These sketches are taken at random from different parts of a country of which Mr. Macculloch, in 1823, prophesied that in "half a century it would certainly be the greatest pauper warren in Europe, and along with Ireland have the honour of furnishing hewers of wood and drawers of water for all other countries in the world." Well might Mr. Laing as, in his tour through France, he read this lugubrious prediction, "look up from the page and laugh" to see around him on the rivers, canals, and roads, in steamboats, iron suspension bridges, new factories, and coal

\* Le Quesne on the Commerce of Jersey, Guernsey and Jersey Magazine, vol. iii. p. 110.

works—numberless proofs of the progress of industry and wealth under the very system so prematurely denounced.\* Mr. Macculloch's own favourite witnesses, Messrs. Birkbeck and J. P. Cobbett, testify against him whenever they descend from the oracular tripod, and instead of prophesying what was to be are content to describe what actually was. "There is no advancement in French society," exclaims Mr. Birkbeck; "no improvement nor hope of it:" yet shortly before he had said, "I have inquired, and everybody assures me that agriculture has been *improving rapidly* for the last twenty-five years; that *the riches and comforts of the cultivators of the soil have been doubled* since that period, and that vast improvement has taken place in the condition and character of the common people. On my first landing I was struck with the respectable appearance of the working class: I see the same marks of comfort and plenty wherever I proceed. *I ask for the wretched peasantry*, of whom I have heard and read so much, but I am always referred to the Revolution; it seems they vanished then. The labouring class here is certainly much higher on the social scale than with us. Every opportunity of collecting information on this subject confirms my first impression, that there are very few really poor people in France. In England,

\* Laing. Notes of a Traveller, p. 53.

a poor man and a labourer are synonymous terms; we speak familiarly of *the poor*, meaning *the labouring class*; not so here.”\* Mr. Cobbett’s comparison between France and England is equally favourable to the former. He *heard* that unless the law of inheritance were changed, “society would become degraded in the extreme,” but all that he *saw* would have warranted more cheering anticipations. He was surprised to find that the “labouring people or peasantry had usually cows of their own, sometimes one, sometimes two or three,” besides pigs; and he could not help seeing that their dress was “better than that of labourers in England,” and that their breakfast of cabbage soup, bread, and wine, was a thousand times better than the “cold potatoes and tea” with which people of the same class in this country often prepare for a hard day’s work. He saw besides, “a great many beggars, but not more of them,” he acknowledges, “in the country parts of France than he would have seen in England if travelling along the same high road:” and he adds, “There is this important difference between the appearance of beggars in France and England: a very large portion of our beggars are neither aged nor infirm, while in France there is scarcely any object of this description that is not old or in some way incapable of earning a

\* Tour in France, pp. 11—22.

living. The greater part of the English beggars beg because they cannot get employment, and the beggars of France beg because they are unfitted for employment. It is the state of society in England which creates the beggar, while in France it is his inability to render society any service.”\*

Compare the statements quoted above, or any other account of the present or recent state of France with the pictures drawn—not by Marshal Vauban, who, in Louis the XIV.’s time estimated that three-fifths of the inhabitants were either beggars or on the verge of beggary,—not by Arthur Young, who, at the commencement of the Revolution found the peasantry half-starved, and distress and misery everywhere prevailing; but with the descriptions given since the Restoration, of a people fed with roots and clothed in rags. The comparison admits of only two alternatives. Either things were not nearly so bad in M. Lafitte’s time as that writer believed, or they have marvellously improved since. Either the pauperism said to be inseparable from peasant proprietorship did not even then exist, or it has since disappeared, although its alleged cause still retains all its vigour. The assailants of peasant proprietorship may choose between the horns of this dilemma. By whichever they may prefer to be transfixed, their

\* Ride through France, p. 210.

perplexity will serve equally to refute their unfounded charges.

One more remark before we leave this part of the subject. Land in France sells much better when offered in small than in large lots. According to the Marquis Garnier, a farm which would let for about 200*l.* a year, could not be sold entire for more than twenty-five years' purchase; whereas, if divided into several lots it might sell for forty years' purchase. This, whatever else it may prove, proves likewise that peasants of the lower grades outbid their betters, which they could not do unless besides gaining enough for their ordinary expenses, they were able to save money. It is true that purchases of small estates are not commonly completed at once, but that part of the price is left to be paid off by instalments, but the credit thus given to the purchaser shows the confidence reposed in his ability to obtain a good deal more than a livelihood from his land, and the preference given to him over his wealthier competitors, shows also how firm and how general is the belief that small farms are more productive than large ones. Land is the bank in which the peasantry invest their savings. They are the highest bidders for it; but as they cannot afford to buy much at a time, it must, when offered for sale, be divided into small lots, in order to be brought within their reach.

Enough has now been said to show that the effect of peasant proprietorship in France, as elsewhere, has been very different from that of promoting pauperism; that the average size even of the smaller properties is more than eight acres, and that their average size has remained without sensible diminution for more than thirty years, during which period the people have been steadily advancing to a higher social position. Their actual situation will suffer little from comparison with that of the most favoured nations, and experience justifies the strongest confidence that their prosperity will be permanent at least, if not progressive. This result too has been obtained notwithstanding the operation of a law of inheritance, whose natural tendency is to increase the number, and to diminish the possessions of landowners; but peasant proprietorship has diffused general competence, competence has engendered prudence, and prudence has counteracted the influence of the law. Not that the law has been rendered altogether harmless. It has not been followed by the fatal consequences expected from it, but it has produced an evil of a somewhat different character, which, though of secondary importance, is still exceedingly serious. This is not the multiplication but the division of estates. The number and the average extent of landed properties have undergone little alteration, but instead of being compact, an estate is commonly composed of several

detached portions. These *parcelles*, as they are technically called, are to the number of properties as twenty to one, so that unless *parcelles* belonging to the same person, although entered separately in the register, are sometimes contiguous, every estate must, on an average, consist of twenty fragments in twenty different places. This is in part the direct effect of the law, which not only assigns to every child a certain proportion of his parent's property, but permits him to insist on having a share of every separate field; but the law acts still more powerfully in an indirect manner, by multiplying sales. The mischief arising from it can scarcely be exaggerated. The expensive litigation, and ill-will occasioned by the partition, the loss of ground in the numberless paths connecting the *parcelles*, and the loss of time in passing from one to another, the mutual trespasses of cultivators whose slips of ground are sometimes so narrow, that the animals employed in ploughing one cannot avoid trampling on the adjoining one, the consequent disputes and law-suits—all these are commented on by Mounier and his colleague with great but not unjust severity. But these evils, although justly attributable to the French law of inheritance, are not its necessary consequences. Such partition as that alluded to, however legal, would be impracticable except in a country open and unenclosed. Thus, it is usual in Alderney, where fences are rare,

but is unknown in the other Channel Islands, where, although peasant proprietorship and gavelkind equally prevail, every field is inclosed with hedges. It was once common, likewise, in the open plains of Germany, until experience of the inconveniences arising from it, led to its prohibition, and it is obvious that it might be put a stop to by the same means in France also. As long, however, as the practice continues, it must present formidable obstacles to the progress of agriculture, which, accordingly, must be confessed to be in a very backward state. But it does not follow that it was ever in a more forward condition, or that it is better on large than on small farms, although both propositions are affirmed more zealously than discreetly by Messrs. Mounier and Rubichon. In support of their assertions, they produce Tables, which their sage Reviewer pronounces "the most minute and accurate ever made of any country," and from which he draws the very remarkable conclusion, that "the average produce of the whole territory may be about 10*s.* per acre," or only 2*s.* more than the rated, and 2*s.* less than the real rent. In justice, however, to the French authors, this must be acknowledged to be another blunder of their Reviewer's, and to be three times as absurd as what they have said themselves. According to them the value of the average gross produce of an acre is 30*s.*, but of this estimate also no more need be said, than that it is founded upon

the same Tables as those which represent the daily average ration of each individual of the whole French population (an average, of course, infinitely above that of the labouring classes) to be no more than fifteen ounces of bread or vegetables, and one ounce and three-quarters of meat. Arguments resting on so rotten a basis are not entitled to the compliment of examination, but one or two facts may be mentioned in opposition to the conclusion at which they are directed. In 1794 the cultivated area of France was estimated by Arthur Young at 108 millions of acres. According to Chateaufieux it is now 114 millions, implying an addition of about  $5\frac{1}{2}$  per cent. Population has meantime advanced from 26 to 33 millions, or at the rate of about 27 per cent. If these estimates be correct, the original area of 108 millions of acres which formerly maintained only 26 millions of inhabitants, now maintains 31 millions, and feeds the larger number much better than the smaller was fed before the Revolution. France was never a large importer of provisions, and is less so now than ever, many articles of food which were once admitted free, being now subject to heavy duties. How then can an additional population of five millions be fed by the produce of the same territory, unless the land be better cultivated than formerly? It is evident that in spite of the great and manifold disadvantages under which the

peasantry labour, in spite of the *parcelllement* of individual estates, in spite of the continuance of the old customs of *vaine pâture* and *parcours*, whereby at certain seasons the cattle of all the inhabitants are let loose to graze over a whole district, the characteristic industry of proprietors, hampered as it is, has yet been so vigorously exerted, as to obtain an increase of nearly one-fifth in the produce of the soil.

So much for the alleged decline of French agriculture generally. The next subject for comparison is the relative cultivation of large and small farms. M. Rubichon finds, that in the forty-two northern departments there are 10,079 properties paying a land-tax of 1000 francs or upwards, while in the forty-three departments of the south there are only 3,282 of such properties: further, that in the north the average rate per hectare is about three francs, and only two francs in the south. Whence, as the rate of land-tax is regulated by the produce of the soil, he concludes that those parts of France are the most productive in which there is the greatest number of rich proprietors.\* The truth of this proposition is unassailable, but its converse is equally true. There are more of large properties in the north than in the south, by about 6,800, but in the north, the number of properties of the smaller

\* Mounier, *ut supra*, vol. i. p. 116.

class is also the greatest by more than a million, whence it appears, that those parts of France are the most productive in which there is the largest number of small properties. So far the balance is equal between the two parties ; it does not appear whether the superiority of northern agriculture is attributable to the prevalence of large or of small proprietors. But sentence must be passed in favour of the latter, when it is considered that they outbid the former not only as tenants,\* but as purchasers. If they merely paid a higher rent, it might be supposed that, like Irish cottars, necessity compelled them to submit to any terms, however unreasonable, in order to obtain land, but they can likewise pay a higher price, which they could not do unless their business were relatively more profitable, and enabled them to save more than that of larger farmers.

Among the supposed signs of the decay of French agriculture, one is the alleged diminution of the number of sheep and cattle. With respect to sheep, it is generally admitted, that small farms are unsuitable for the management of them, and it is probable enough that sheep-farming, which, as Young informs us, was very ill understood, even before the Revolution, was still less practised in the period

\* According to M. Passy, the average rent per hectare, of large, middling, and small farms, is in France, 75, 85, and 140 francs respectively.—*Systèmes de Culture*, pp. 102, 103.

immediately following that event, and after the domains of the clergy and nobility had been distributed among forty times as many owners as before. As long as the average size of estates was decreasing, the number of sheep may also have decreased, but during the last thirty years at least, the former has remained nearly stationary, and it may fairly be presumed that the latter has undergone as little variation during the same period. At any rate, much stronger proofs of its having recently declined are needed than those produced by M. Mounier, who in the whole kingdom has only been able to discover two communes in one of which seven flocks have disappeared in thirty years, and in the other, five flocks in six years.\*

Small farms do not lie under the same disadvantage with respect to the breeding of horned cattle: on the contrary, when well managed, they appear to be peculiarly adapted to it. In England, there are seldom more than ten or twelve head of horned cattle on a farm of a hundred acres; but a Flemish farmer of fifteen acres, of which only seven or eight are under green crops, will keep six beasts stall fed.† Yet in France the national stock of cattle is said to have diminished since the Revolution, and the assertion, unlike most of those put forth by the same parties, is not a mere assumption, but receives

\* Mounier, *ut supra*, vol. ii. p. 125.

† Flemish Husbandry, p. 80.

countenance from the unquestionable fact that the supply of beef to several towns bears a smaller proportion than formerly to the population, and that the price has likewise risen considerably. The supply has increased, but not so much as the number of inhabitants. In Paris, for instance, the consumption of meat was 150lbs. for each person in 1789; but in 1841, the average had fallen to 121lbs.; of beef, the consumption per head is said to have fallen from 105lbs. to 54lbs., and the price to have risen 16 per cent. in seven years. Mr. Mill has given a satisfactory explanation of these phenomena without ascribing them to the substitution of small for large farms, which should naturally have produced effects directly opposite. "In Paris, before the Revolution, there was, comparatively speaking, no production at all, but only distribution; the population consisted of the great landlords, the court and higher functionaries paid by the state, the bankers, financiers, government contractors, and other monied classes, with the great and small dealers and tradesmen needful for supplying these opulent customers, and few labourers beyond those who could not be wanting in so large a town. In such a city the rich must have borne an unusually high numerical proportion to the poorer consumers."\*

\* Morning Chronicle, Jan. 16, 1847.

But Paris has since become one of the chief seats of French manufacture, and the addition of one-third to the population is no doubt principally owing to the augmentation of the labouring and poorer classes. As the poor eat much less meat than the rich, such a change in the numerical proportion between the classes would occasion a corresponding reduction in the average consumption per head of the whole population. This would be the case even if the demand continued to be adequately supplied, a supposition, however, which is inconsistent with the rise of price that has taken place. But this rise of price does not necessarily imply a decrease in the number of native cattle. The increasing demand of towns can only be met by supplies brought from a distance, and at an expense continually increasing; and in order to convey increased supplies to inland towns, like Paris and Lyons, to which, before the discovery of steam navigation and the construction of railways, cattle could only be brought by tedious land journeys, the increase of expense must have been considerable. Again, France was formerly a large importer of foreign cattle, which, until 1814, were admitted free; but, in that year, a duty of three francs on every head of cattle was imposed, and, in 1822, a sudden increase of the duty to 55 francs nearly put a stop to the importation. "Moreover, the *octroi* or town custom duty, now so burthen-

some, did not exist at all in 1789, and has been largely increased at various periods, both in Paris and most other towns since its first establishment." These three causes seem to be quite sufficient to account for the enhancement of price without attributing it to a diminution of the national stock of cattle, a supposition which, although it cannot be completely disproved for want of sufficient evidence, is contradicted by such partial evidence as is procurable. We have no means of comparing the present number of cattle existing throughout France with that existing at a remote period, but we are able to make such a comparison in particular districts. For the Department de l'Eure, for instance, a very careful statistical report was drawn up in 1800, from which and from the investigations made in 1837, it appears that in the interval the quantity of live-stock increased exceedingly; horses, increasing in number from 29,500 to 51,000; horned cattle, from 50,000 to 105,000; swine, from 36,000 to 49,000; and sheep, from 205,000 to 511,000.\* It may be objected that this Department is one in which large farms are more numerous than in most parts of France; but it appears that large and small farms are intermixed, and that the relative proportions have not perceptibly varied since the

\* Passy. *Changemens survenus dans la Situation Agricole du Département de l'Eure*, p. 12.

commencement of the present century. Those, however, who may nevertheless think that the large farms alone are entitled to the credit arising from this increase of live stock, may be induced to change their opinion by a statement of some particulars respecting the commune of Vensat, in Auvergne, one of the provinces in which, if anywhere, morcellement of land has been carried to excess. The arable land of that commune was occupied, in 1790, by thirty-seven farms. The present number of farms is not stated, but the number of properties is 591. But, in 1790, there were only 300 horned cattle, and from 1800 to 2000 sheep; there are now 676 of the former, and 533 of the latter; so that it has gained 376 oxen, and lost 1800 sheep; or, as ten sheep are reckoned by French agriculturists to be equivalent to one cow or ox, its real gain may be stated at 246 oxen.\* A still more satisfactory account is given of the arrondissement of Fougères, by its Sous-prefet M. Bertin, who tells us, that between 1813 and 1844, horned cattle multiplied from 34,500 to 51,900; sheep, from 6300 to 11,000; swine, from 9300 to 26,000; and horses, from 7400 to 11,600.† It may be added, that in the Department du Nord, cattle are most abundant in those districts in which

\* Passy. *Systèmes de Culture*, p. 119.

† Bertin. *Notice sur la Baronie, &c. de Fougères*, p. 390.

farms are smallest. The arrondissements of Lille and Hazebrouck, besides a greater number of horses, maintain, respectively, fifty-two, and forty-six oxen, on every 250 acres, while the arrondissements of Dunkerque and Avesnes, in which the largest farms are situated, maintain only forty-four and forty, respectively.\*

General descriptions are seldom at once both literally accurate and sufficiently distinct, nor is the aspect of a large country ever so uniform that in many places deviations from the prevalent character may not be detected. Taking a comprehensive survey of France, we have seen that the number of landed proprietors has long remained nearly stationary; that cultivators deriving a livelihood from their own fields have in general land enough for their maintenance in comfort, and that the condition of the peasantry, and of the other labouring classes, has for many years been steadily improving. But the truth of this statement is not incompatible with the existence of many exceptional cases. That peasant proprietorship is a well-spring of poverty is a notion utterly groundless, but to represent it as a palladium against indigence would be only a few degrees less absurd. Its tendency is assuredly both to give and to secure to the agricultural classes the possession of competence, but its influence may be

\* Passy. *Systèmes de Culture*, pp. 118, 119.

counteracted by numberless opposing causes. Men are not mere machines, to take invariably the course prescribed for them; self-will is sometimes more than a match for self-interest, and even if they were willing to be guided by prudence, they could not always provide against extraordinary accidents. Instances no doubt occur of a peasant's sons who will not acknowledge the necessity of selling their little patrimony, and who, persisting in their efforts to gain a living from the patch of ground which has fallen to their share, have to struggle desperately for subsistence. But, in opposition to such acts of folly are to be set cases of more than ordinary thrift and foresight, which counteract the effects of the former, and maintain undiminished the proportion of the prosperous to the unfortunate. The examples of poverty, however, are not all isolated. Both in France and in some parts of Germany, the peasantry of entire villages are reduced to severe and long continued distress. The causes of their misfortunes are probably somewhat different in every instance, and cannot be precisely determined without a knowledge of many local circumstances, but a reasonable conjecture may be hazarded as to their most usual character. When the cultivators are only tenant-farmers, their embarrassment may arise from a fall in the market price of their produce. If in England the cheapness consequent on an abundant harvest is

invariably accompanied by a cry of "agricultural distress," and if English landlords, making a virtue of necessity, are frequently obliged to take the praises of the county newspapers in payment of their irrecoverable dues, it is not very wonderful if something of the same kind should sometimes occur in France; and if there also arrears of rent should occasionally remain long unpaid. It may be thought, however, that cultivators of their own lands should be comparatively unaffected by fluctuations of the market; that, selling no more of their produce than what remains after their own consumption is satisfied, they should at all times be equally well supplied with the necessities of life, and should suffer from no other deficiency than that of the less indispensable articles which they are obliged to buy. But, besides that, many of the so-called peasant proprietors of France have not completed the purchase of their property, and are more properly tenants at a fixed rent; they frequently employ only a small portion of their farms in raising provisions. Notwithstanding the superior productiveness of their mode of husbandry, when applied to grain or to esculent vegetables, their superiority over larger farmers is shown still more decisively by crops requiring more minute and constant attention. In many districts they find it most profitable to cultivate hemp, or flax, or hops: in others, their chief

dependence is on their vineyards, or orchards, or plantations of olive or mulberry trees. The crops thus obtained are more valuable than corn or roots, but they are also more liable to failure, and the demand for them is much more irregular. The proprietor must sell in order to buy necessities, and if unfavourable weather have lessened the quantity or injured the quality of his produce, or if a change of taste or fashion, or a superabundant supply, or an alteration of custom-house regulations have lowered the price, the money he obtains may be insufficient for his wants, and he may be compelled to borrow in order to live. A succession of bad seasons will plunge him deeper and deeper into difficulties, and a continuance of the causes which have lowered prices may ruin him irrecoverably. Many owners of small vineyards in the neighbourhood of Paris have suffered much within the last thirty years from the competition of the vinegrowers of the south : owing probably to some similar cause, some of the smaller proprietors in the arrondissement of Fougères are obliged to borrow seed for sowing their fields ; and, since the accession of Nassau to the Zollverein, and the consequent abolition of the monopoly they formerly enjoyed, some of the inhabitants of at least one village in that Duchy, have been compelled to surrender their lands to their creditors.\* But would

\* Passy. *Systèmes de Culture*, pp. 72—75 ; Bertin. *Notice sur la Baronie*, &c. de Fougères, p. 336.

these disasters have been escaped by larger farmers similarly situated, or would not they have been equally affected by a permanent depreciation of their produce? Their losses might not indeed have been so extensively felt. When they ceased to fulfil their engagements to their landlords, they would have been removed to make way for fresh tenants at reduced rents, who might have continued to employ as many labourers as their predecessors, whereas, where properties are much divided, the owners are themselves both farmers and labourers, and their misfortunes are those of the whole agricultural body. But this does not prove that peasants are necessarily more secure as hired servants than as proprietors. It proves only, if it proves anything, that they should not trust to the sale of their produce for the means of subsistence, but should raise their own provisions; but it would be difficult to show why this obligation should be imposed upon them, more than upon artisans and handicraftsmen, and the multitudes of other labourers, who live by the sale of their work.

The foregoing pages were written before the publication of the *Treatise on Succession to Property* by Mr. Macculloch, who, in the Chapter on Compulsory Partition, treats at some length of peasant proprietors, and particularly of those of France. What he there says on the subject, (though he avails himself of the opportunity to retract or modify one or two

of his early opinions), is for the most part a repetition either of statements made in former works by himself, or of the fallacies of Messrs. Mounier and Rubichon, and has already been brought before the reader's notice. One of his arguments, however, is sufficiently novel to deserve a distinct examination. It is drawn from the dearth of the year 1846—7, the distress consequent on which was, according to Mr. Macculloch, "wholly confined to the countries in which subdivision has been carried to excess,—that is, to Ireland, France, parts of Belgium, and of Rhenish Prussia," whence it is inferred that, "even in the best years, occupiers of small patches have but little produce to part with; and that in unfavourable years they are themselves, as well as those who depend on them for supplies, usually involved in the greatest difficulties."\* Here, premises and conclusion appear to be equally erroneous. The distress of the period referred to was not confined to countries of small farms, nor are the peasantry of such countries peculiarly disqualified for contending with the calamities of adverse seasons. It is true, that during the recent scarcity, England suffered less than some of her neighbours; but it is not true that no countries suffered except those in which land is minutely divided. The dearth extended

\* Macculloch on Succ. to Prop. pp. 130, 131.

over almost the whole of Western Europe, from the Baltic and North Seas to the Mediterranean and Atlantic; and from the unexampled price to which bread rose at Lisbon, would seem to have been still more acutely felt in that capital of a kingdom of large farms, than at Paris or Brussels. Neither was the comparative exemption of Britain owing to the excellence of her agricultural arrangements: it is to be ascribed entirely to the fact of her having escaped one of the visitations that afflicted her neighbours. In common with them she suffered from the failure of the potato, but the loss in her case was partially compensated by an abundant wheat harvest; whereas in theirs, it was aggravated by a deficiency of all grain crops, especially of rye. Having thus less to bear, she was able to bear it better; but there is no reason to suppose that she would have exhibited greater patience if subjected to the same trial. Whenever, on former occasions, her wheat crops have actually failed, the peasantry have suffered at least as grievously as those of other countries; and it is indeed difficult to understand how the fact of their being hired labourers, instead of small landowners, should enable them to bear up better against their difficulties. The latter, unless their farms be unusually small, raise, in ordinary years, more produce than they require for their own consumption, and in bad

seasons can, if they please, retain the whole for their own use instead of sending any to market, so that the worst evils of scarcity must be felt, not by themselves, but by their customers, the non-agricultural part of the community. Even if their farms be so small as in ordinary years to produce no greater quantity of provisions than they themselves require, their position is still at all times at least as good as that of the hired labourer. If in a bad year they obtain only half a crop, they must place themselves on half rations; but the labourer at the same time receiving his usual wages, would not, on account of the rise of prices, be able to buy more than half his usual allowance of food, nor indeed nearly so much, for as is well known, the price of provisions always rises much more than in proportion to the deficiency of the supply. The comparative security against want enjoyed by small proprietors and by labourers may be estimated from the degree of their dependence on public charity. Thousands of English labourers are supported during a part of every year at the public expense; and it is the aid which they derive from the poor's rates that prevents them, in periods of distress, from breaking into open violence more frequently than they actually do. The French peasantry, on the other hand, are in general self-dependent; and the interference of the government last year, in order to procure for them

additional supplies of food, was a step almost without precedent. What amount of money may have been expended for this purpose, is not very generally known, but it was certainly nothing like ten millions sterling, to which sum it must nevertheless have reached in order to correspond with the amount annually expended on the relief of the poor of the much smaller population of England. Yet the condition of peasant proprietors is pronounced to be peculiarly unfortunate, because on an occasion of extraordinary exigence, such as does not occur once in a century, exertions were required for their relief, very inferior to those which are annually made in a country where peasant proprietors are scarcely known.

Besides, if we had more minute information respecting the distress recently experienced in France, we might very possibly find that among the multitudes fed at the public expense were very few peasant proprietors, and no great number of peasants of any description. It is certain that the sympathies of the government were principally excited by the clamours of the populace of the capital and other large towns, and it is likely enough that in this as in many other instances, Paris and France were confounded, and that distress was hastily assumed to be national, which, if analysed, would have proved to be much more urban than rural. It may be recollected that

during the last winter the tranquillity of the usually contented and peaceable Channel Islands was partially disturbed, and that food riots took place in Jersey. The rioters were, however, exclusively townspeople, and the greater part of them were labourers on the public works. The peasantry not only took no part in the tumult, but never seemed to suffer anything more than inconvenience from the unusually high price of provisions. Scarcely an instance occurred in any of the islands of the owner of a piece of ground, however small, condescending to apply for parochial relief.

In one district, however, of one of the countries mentioned by Mr. Macculloch, the distress was certainly felt most acutely in the rural districts. In Flanders it was the very small landowners who suffered most; nor has their distress disappeared with the causes which for awhile aggravated its symptoms. Although the dearth of 1846-7 has been followed by a plentiful harvest, many of the Flemish peasants are still in great want; pauperism and mendicancy are making progress amongst them, and the Belgian legislature has for some time been anxiously debating by what means these plagues can be arrested. Of course this state of things is triumphantly referred to as corroborating the doctrines of the opponents of peasant proprietorship. Under that system the Flemings have indeed flourished for

ages, yet no sooner does a calamity befall them, than what had previously been regarded as the source of their prosperity, is pronounced to have occasioned their ruin. For ages they have lived in competence on farms which have been transmitted from generation to generation without diminution of size, yet the possession is suddenly discovered to have always contained the germs of pauperism. By those who are unwilling to believe that effects so directly opposite can have proceeded from the same cause, a more reasonable explanation may be easily found. Land has long been more minutely divided in old Flanders than in other parts of Belgium. Among the farmers properly so called—that is to say, among those holding land sufficient for the occupation and maintenance of a family—are interspersed many smaller occupiers, whose territorial possessions are nothing more than gardens; and it is this class whose condition has lately undergone so deplorable a change. But these men could never be properly called husbandmen. Their situation closely resembled that of the rural artisans of Switzerland. The produce of their plots of ground formed only a small part of their means of subsistence; the spade enabled them agreeably to vary their employments, but their chief dependence was on the wheel or loom. Most of them were spinners of thread, or weavers; and as long as the articles made by them kept up their

price, their earnings were sufficient for their decent maintenance ; but latterly they have been subjected to a rivalry with which it is in vain to struggle. Their manual labour has had to compete with steam, and has, of course been outdone—the factory has been raised at the expense of the cottage. The rural spinners and weavers have thus been deprived of their principal resource ; but theirs is evidently a case, not of agricultural, but of manufacturing, distress. Their connexion with the land may, and no doubt does, alleviate their misery, but cannot, in any conceivable manner, have helped to produce it. If they had been landless operatives, they must, in losing their occupation, have lost everything. As it is, they are saved from utter destitution by the possession of their plots of land. In either case they must have been reduced to poverty ; but it is surely a strange perversion of the truth to impute their ruin to the very cause which prevents it from being complete.

## CHAPTER IV.

## MORAL EFFECTS OF PEASANT PROPRIETORSHIP.

UNLESS the preceding pages have been written in vain, peasant proprietors may now perhaps be acknowledged to deserve the praise of industry and foresight ; but to complete their portraiture others of their characteristics must be mentioned, and (since even they are not altogether faultless monsters) some defects as well as excellencies must be included in the list. Among the latter, honesty, sobriety, and loyalty, duly combined with independence of spirit, are pre-eminent, as might indeed have been expected, for circumstances could scarcely be more favourable to the development of those virtues. Honesty, in the most common, if not the most exalted, acceptation of the term, signifies little more than respect for the rights of property, and none are so likely to pay such respect as those who have property of their own which they wish to see respected. Where there is no feeling there cannot well be sympathy. An Arab, meeting you in the desert, will bid you undress, because your aunt (his mother) is without a garment, and because so dutiful a son as himself is, of course,

little better provided. If he had been accustomed to wear good clothes, he would be more scrupulous about stripping a cousin so unceremoniously. Nowhere does the national reputation for probity stand higher than in England, and nowhere is it better deserved. Among so commercial a people mutual confidence is indispensable; the quality on which alone confidence can securely rest has (in nice accordance with the principles of political economy) come forward to meet the demand, and the puritanical spirit which still influences us so strongly, both for good and evil, has helped to strengthen and foster it. But although certainly one of our national virtues, honesty is no longer a characteristic of the poorest classes of our countrymen. Take a rustic, for example,—a man working at fourteen or fifteen pence a day, and himself the son of a day-labourer, not more liberally remunerated. Perhaps he has received some sort of education, and at a National or Sunday school may have been made acquainted with the Divine commandment against stealing. He does not presume to dispute the authority of the precept, but he is not convinced of its justice. It meets with no echo in his breast. Why should he not steal? He may be answered that he should do to others as he would have them do to him; but he has himself no fear of being robbed, for he has nothing worth taking, and having scarcely ever experienced the

feelings of ownership, he cannot readily understand them or the pain occasioned by their violation. The law offers him nothing, save a protection which he does not require, while it forbids him from benefiting at other people's expense. He is strongly tempted, therefore, to evade it whenever he can do so with impunity. He is too closely watched to have many opportunities of the kind, but he is likely to avail himself of such as occur. He will break down fences for fire-wood, take tithes of all fruit-trees within his reach, and appropriate to his own use whatever waifs and strays may come across his path. These are trifles; but as straws show how a stream flows, trifles will serve well enough to mark a man's disposition, and to declare whither it would urge him if freed from restraint. English field-labourers are probably understood by none better than by their own employers, and what the latter think of them may be inferred from one of the most common objections to cottage-allotments, which farmers are opposed to, because they say it would be impossible to distinguish between the produce which an allotment-holder had raised, and that which he had plundered. It is far otherwise in countries in which the same persons are cultivators and owners of the soil. A peasant proprietor may be said to feel, as well as to understand his moral obligations. His anxiety to preserve his own rights from invasion,

informs him that his neighbours are similarly solicitous, and he knows that unless he abstains from molesting them, he cannot reckon upon their forbearance. He teaches his children the same wholesome lessons. In England, if you catch an urchin in your garden filling his pockets with apples and pears, you will most likely horsewhip before dismissing him, but your choler will have been excited principally by a sense of personal injury, for the offence is of too common occurrence to move your indignation very greatly by its intrinsic turpitude. It may possibly remind you of some events of your own schoolboy days, and that "boys will be boys," may be the most serious of your moral reflections. But in France and Germany, the fruit on the wayside trees is left untouched by boys and beggars, and in the Channel Islands many a tempting orchard is not much more effectually barricaded than if it belonged to Cimon the Athenian. In the latter islands, what robberies take place are for the most part committed by strangers, the purer natives being very rarely in fault. Of 2107 offenders, of all descriptions, tried in Jersey, in the ten years ending with 1845, only 670 were natives of that or the neighbouring islands, 1264 were English, Scotch, or Irish, and 173 foreigners.\* Distribute the tenth

\* Report on the Criminal Laws of Jersey by the Commissioners, Messrs. Ellis and Bros.

part of 670 among a population of 33,000, and there will be annually but two offences cognisable by a court of justice, for every thousand of the native inhabitants.

Mr. Macculloch employs a somewhat arbitrary process in order to convict small farmers of dissipated habits. They cannot, he argues, have full occupation at home, nor can they obtain employment from their neighbours; they must consequently, perforce, be often idle, and, as

“Satan finds some mischief still  
For idle hands to do,”

they must, from sheer listlessness, have frequent recourse to the bottle, when a train of consequences will ensue, which only the pencil of a Cruikshank can adequately delineate. To be sure, a man who must work with his own hands for his living, and yet wastes half his time, cannot well have a vast sum from his earnings to spare for liquor; but this is treated as only a slight impediment to the indulgence of his propensity. “The small farmer,” we are told, “must have his porter and gin, as well as the extensive farmer,” and need not be prevented by emptiness of purse from drinking as becomes his rank. “The want of time and opportunity,” it seems, “still more than the want of money, prevents a hired labourer from aping the conduct of his employers;” but a small farmer, however penniless, has at least

time enough at his disposal, and can therefore get as drunk as a lord whenever he pleases.\*

Here is a curious tissue of gratuitous assumptions. It is first decided that small farmers have not half enough to do; next, that forced inactivity makes them lazy; and finally, that they while away their hours of idleness by getting drunk; whereas, in reality, they are the most hard-working of mortals, and having no unoccupied leisure, have no need to resort to the pastime so considerately proposed for them. In their fields and gardens, their outhouses, looms or workshops, they find wherewithal to fill every vacant minute, whether in summer or winter, and idleness offers them neither temptation nor excuse for dissipation. Not that their sobriety is without merit, as being the result of necessity. Provided they hold their land by a secure tenure, incessant diligence commonly rewards them with the competence they deserve; and, busy as they are, they could no doubt, if so disposed, steal a minute now and then to take off a dram; but they value money too highly to squander it on intemperance, either in meat or drink. Their fault is rather to be too sparing in their diet. What most frequently sends a man to the alehouse is the discomfort of his home. The ill-paid day labourer flies from his dreary hovel,

\* Compare Statistical Account of British Empire, vol. i. p. 451; and Encyclop. Brit., vol. vii. p. 389.

and the wan looks of his wife and children, to his snug seat in the chimney-corner of the inn parlour, and the merriment of his boon companions ; but the peasant proprietor, or leaseholder, has a blazing hearth and a neat parlour of his own, and sitting there, with his family about him, has no wish for a change of scene or company. That a British writer should impute habits of intoxication to small occupiers of land, is the more extraordinary, as no peasantry on earth are so strongly addicted to the vice as the landless labourers of his own country. The French paysan, or German bauer, can spend a holiday in dancing and singing, and yet return from the village wake as decorously as he went to it; but with an English rustic, festivity and beer-swilling are synonymous terms. And the system which has so degraded the descendants of the "noble yeomanry," once "the honour and strength of England," is held up for admiration !

It is wonderful how long a time must elapse before changes in national characteristics are generally acknowledged. Yeomanry, as a class, have long been almost entirely rooted out from amongst us ; but they are spoken of as familiarly at agricultural dinners as if they were still as numerous as ever. We walk between two lines of hovels scarcely good enough for cows of any tenderness of nurture, and we are called upon to admire the convenience

and beauty of English cottages, by an imaginative companion whose thoughts have strayed from the objects before him to the "peasant nest" and picturesque huts,

" All hidden in a sylvan gloom, some perched  
On verdant slopes from the low coppice cleared,"

described by Cowper and Wilson. So likewise our agricultural labourers are occasionally eulogised for their proud self-reliance and frankness of demeanour, just as if they still held it disgraceful to accept parish relief, or could always by their own exertions avoid that shameful necessity. In times past, when none who chose to work were in danger of want, they were indeed distinguished by the qualities referred to, which, however, it would be too much to expect from men who must receive as a favour employment at eight or nine shillings a-week, who have little or no work in the winter, and no substitute for it, no cow, no pig, no garden-stuff; whose present subject of anxiety is the difficulty of obtaining out-door relief, and whose future prospect is that of ending their days in the workhouse. Independence of spirit and manner cannot reasonably be sought, except among those who are assured of a livelihood, and no peasantry have such just ground for confidence on that score as those who cultivate their own lands. Deriving their support from their own resources, they can indulge in the pride of self-

dependence, and scorn the idea of owing their subsistence to charity. Neither desiring the favour, nor fearing the enmity of their richer neighbours, they can accost them without servility. Not that the possession of property, in giving them independence, renders them insubordinate : while it permits them to respect themselves, it teaches them also to respect the laws.

A mere day-labourer, half employed, and wretchedly paid, who is compelled to apply to the neighbouring landowners for a livelihood, and obtains from them only a miserable subsistence, not unnaturally regards his employers as oppressors, takes every opportunity of showing his spite against them by wanton aggressions, and is ever ready to listen to the harangues of seditious demagogues. But a peasant proprietor has no such cause for envy or animosity against the owners of larger estates, but is rather disposed to join with them in repelling any attack on their common rights ; he is deeply interested in the preservation of tranquillity, and proportionably fearful of civil convulsions, in which he might lose his all. He molests no one who does not molest him ; and as for politics, provided neither his privileges nor his prejudices be attacked, he cheerfully leaves them to those who have more taste and capacity for their discussion. Throughout western Europe, from the Polar to the Mediterranean seas, wherever there

re peasant proprietors, there likewise is an orderly and loyal rural population. In the Channel Islands, Norway, Belgium, Switzerland, and Germany, there are no rick-burners, no breakers of thrashing machines, no riots among the country people, and no secret disaffection. The peasantry are thriving and content, and sincerely attached to the laws under which they enjoy so much happiness. Even France presents no exception to the truth of this remark. Popular outbreaks are certainly of frequent occurrence there, but they do not take place in the rural districts. The glories of the last Revolution, and the glory or the shame of the many subsequent attempts to imitate it, belong not to France, but to Paris, and within the capital and a few more of the principal towns, the revolutionary spirit is almost exclusively confined. The French peasant "is no politician; he leaves it to the inhabitants of cities to settle state affairs. He receives, indeed, with goodwill the blessings of political freedom when they are tendered to him, and congratulates himself upon being '*un Français*,' but such matters do not occupy his mind, and if the question were whether he should attend a political meeting or a village festival, he would stick a nosegay in his breast, and a ribbon in his hat, and seek the village green."\* The

\* Inglis, Switzerland and South of France, vol. ii. p. 271.

countryman whom Inglis questioned on the subject, no doubt spoke the sentiments of his class when he said, that "all governments were alike to him, so that they kept at peace, and allowed him to live at home." \*

Among the incidental advantages possessed by small proprietors, should be mentioned one enjoyed by them in common with small tenant farmers and allotment holders, viz., the facilities which their social situation affords for the moral and technical training of their children. The latter, instead of being suffered to run wild, or instead of being locked up to keep them out of harm's way, are almost constantly under the eyes of their parents. They follow their father to his work, and think it as good as play to perform the light tasks he assigns them. Gardening, and the care of poultry and animals, favourite occupations with all children, afford them at once exercise and amusement, and afford also uses for offal and other refuse which would otherwise have been thrown away; and these pursuits are not the less cheerfully followed because they are perceived to be profitable, to lighten the common toils and to increase the common stores. The girls, besides, help their mother in-doors, and in the same pleasant and unconscious manner are initiated into the mysteries of housekeeping, and taught the important secret

\* Inglis, Switzerland and South of France, vol. ii. p. 286.

how to make home happy. Such constant co-operation of all the members of a family, tightens the bonds of affection and promotes domestic harmony, and more directly favours the adoption of early habits of industry and frugality, and imparts early instruction in those particular kinds of information which are most likely to be practically useful in after-life. Perhaps I should be accused of riding my hobby too hard if I were to add, that the importance of this domestic education is exemplified by the present race of domestic servants, who were certainly not so generally declared to be "the greatest plague in life," when the class from which they are chiefly taken consisted not of mere hired labourers, whether agricultural or manufacturing, but of persons who partook more or less of the character of cottage farmers.

Perfection is unattainable on earth, and peasant proprietorship, like everything else of human institution, has its dark side; but it was not, perhaps, to be expected that its most usual defects should be those least consistent with its acknowledged excellences. Extremes, however, meet, and virtues carried to excess run into the opposite vices; and thus it is that the frugality of small proprietors, though the firmest supporter of their independence, not unfrequently passes into meanness, and sometimes even oversteps the barrier of honesty. The habit of saving, by long

practice, becomes a pleasure, and finally a passion, not overscrupulous about the means adopted for its gratification. The Jersey peasantry (differing in this, far as the poles asunder, from their countrymen of higher rank) are said to be so far inhospitable as to be unwilling to give anything, however trifling, to a stranger without payment ; and according to Inglis, although generally far above stealing and incapable of a breach of truth, they are not proof against the temptation of overreaching in a bargain. The same ubiquitous traveller tells us how, while walking from Lachen to Glarus, he was beset by beggars in the shape of children, who left their play to assume the whining tone of practised mendicants, while their parents stood by encouraging them to ask for alms which they did not need : and how, in some parts of the Grisons, " where the inhabitants are accustomed to see strangers, you cannot pass a hamlet without being assailed by children, while the parents, richer, perhaps, than you are, stand at the door with an air of Grison independence."\* He adds some anecdotes of the petty frauds practised upon him, in explanation (not, of course, in extenuation) of which it may, however, be mentioned that peasant proprietors are far more prone to impose on themselves than on others, often cheating themselves even of their just

\* Inglis, Switzerland, vol. i. pp. 63, 139.

allowance of food. Whatever be their pecuniary circumstances, they very frequently condemn themselves to lenten fare. Those of Norway, Belgium, and Switzerland, are exceptions to the rule; but in Jersey, even the better sort of farmers do not, or at least till within the last twenty years, did not, use meat except as an occasional luxury: their standing dish was a soup made of cabbage, lard, and potatoes, and this with bread and butter furnished the materials for every meal. The German bauers also live chiefly on soups and puddings, and so likewise do the French. Now, mere abstinence from meat would be by no means remarkable, for meat neither is nor can be much used by the working classes of any thickly-peopled territory, nor is it indispensable to the attainment of the highest degree of bodily vigour, for nowhere can more athletic frames be found than those fed with maize and milk in the Tyrol, or with potatoes and milk in some of the least wretched parts of Ireland. Provided the diet of a people be sufficiently plentiful and nourishing, it matters little of what it is composed. But the peasantry of some of the countries referred to above are so much more careful of their pockets than their stomachs, that they stint the latter even to the injury of their health and strength. Physicians attribute to low diet the prevalence both of dyspepsia and rheumatism among the country people of the Channel Islands.

Inglis, who had often inspected the flower of the Jersey men while going through their militia exercises, says he saw few fine, well-grown forms amongst them, and no one who has crossed the straits of Dover can have failed to notice within what diminutive bodies are compressed the gigantic souls of the French soldiers. This is a matter of national importance. "La destinée des nations," says the author of the *Physiologie du Gout*, "dépend de la manière dont elles se nourrissent;" and a philosophic eye might, perhaps, distinguish in the combats of Agincourt and Waterloo, a conflict of adverse principles—the triumph of fibrin over gelatine and osmazome—of roast beef over frogs and soupe maigre. If peasant proprietors always restricted themselves to hermit's fare, they would not only pay too dearly for the advantages of their position, but would always be in danger of being deprived of them by such of their neighbours as used a more generous diet. One of those resolute theorists who are never at a loss for facts to suit their purpose, goes so far as to affirm that subjection to a foreign yoke has been their lot in all ages. Nations à *petite culture* (small cultivators), says M. Tapiès, have always been invaded and conquered by nations à *grande culture* (large cultivators); a remark which needs no other reply than an expression of astonishment that it should have been made by a countryman of the small cultivators who,

within living memory, overran two-thirds of continental Europe. It cannot be denied that peasant proprietors do, in certain circumstances, become excessively penurious, but only, it should seem, when no examples of liberality are placed before them. Left to themselves, they contract niggardly habits; but intercourse with the classes above them appears to cure them of those defects. In England, people of all ranks have always been famous for their love of good cheer, and the peasantry, as long as the possession of land gave them the means of indulging their tastes, were not less celebrated as trenchermen than their betters. The reason of this was, that in England the gentry, instead of congregating in towns as in most continental countries, resided on their estates, and keeping open house and a plentiful table, set an example of profusion which was imitated by their inferiors according to their ability. It may be worth mentioning that in Guernsey, the smaller of the two principal Channel Islands, and the one in which the residences of the rich are most scattered, extreme parsimony is much less frequent among the labouring class than in Jersey, and the mode of living is more expensive. Even in Jersey the fare of the country people has sensibly improved since the formation of good roads and the progress of commerce have brought them into more frequent communication with the inhabitants of the town.

Most of the other failings with which peasant proprietors, as such, are sometimes justly chargeable, seem to proceed from the same source as their inordinate parsimony. Ignorant self-sufficiency, coarseness of mind, and rudeness of manner, are natural to those whose days are spent in incessant bodily labour, and who are cut off from intercourse with classes enjoying more leisure and more abundant means for intellectual cultivation. Wherever, as in the greater part of Germany, the gentry live entirely in towns, and abandon the rural districts to a labouring peasantry, the latter seeing none superior to themselves, form their standard of excellence from their own practice, to which they become absurdly bigoted, while they conceive a stupid prejudice against all customs which differ from their own. Wholly absorbed in material cares, they remain in ignorance of the higher gratifications of which man is capable; they cannot aim at elegance and refinement of which they have no examples, nor sympathise with sensibilities which they do not understand; they continue through life plodding and dull, and their demeanour answers to the obtuseness of their nature. Education by itself is not calculated to have much effect in humanising them. They may have been taught to read, but they have little time and less inclination for availing themselves of the acquirement. In their brief intervals of leisure they

are too much exhausted by toil to seek for recreation in intellectual exertion. The civilisation of the lower orders of society can scarcely originate amongst themselves, but must rather descend from the ranks above. The rich are too often unmindful of their duties, but they have an important office to discharge. To them it belongs to encourage science, literature, and art, to diffuse the blessings of knowledge, to exhibit in their own persons the advantages of mental cultivation, and to set examples of intelligence, delicacy, liberality, and good taste. These are their peculiar functions, the discharge of which is scarcely less necessary for the attainment of the legitimate objects of human society than the performance of the labours by which it is fed and clothed; but the fulfilment of these duties is impossible unless the rich are intermixed with the other classes, and if a class so numerous as the agricultural is isolated from the rest, and consists wholly of members who must work with their own hands. But this is an arrangement of society very different from that which it is the object of these pages to recommend. By the preceding vindication of small farmers and small proprietors, it was not implied that all farms and all estates should be small. Very little reflection will show that disparity of ranks and fortunes is essential to the welfare of mankind. If a community in which there are many indigent, cannot properly

be called happy, the happiness of a community in which there are none rich enough to command and to avail themselves of leisure, cannot be of a much more exalted character than that of cattle. To secure the welfare of agricultural labourers, it seems indispensable that they should not be entirely dependent on the hire of their services, but should be owners or tenants of pieces of land sufficient to afford them occupation and subsistence when they cannot procure employment elsewhere. It is also desirable, at least, that of the holdings large enough to be entitled farms, some should be small enough to lie within reach of a mere labourer's ambition, and stimulate him to exertion by offering him hopes of rising above his actual station. But it is not less desirable that there should also be many farms so extensive as to require the superintendence of men of considerable wealth and proportionate instruction, who would avail themselves of the discoveries of science, and effect improvements in agriculture, and would also serve as models for their humbler neighbours in their modes of life and general habits of thinking, as well as in the conduct of their business. All peasants should be landholders, but all landholders should not be peasants. In the agricultural, as in all other classes, the interests of the members would be best promoted by a just gradation of ranks,

## CHAPTER V.

## IRELAND; PAST, PRESENT, AND FUTURE.

IRELAND, even more commonly, and with more confidence than France, is appealed to as testifying strongly against small farms and small properties. The "cottage system," it is said, has there been tried on a very extensive scale, and has utterly and lamentably failed. Five-sixths of all the farms in the island are less than fifteen acres in extent, and nearly one-half are less than five acres; yet in no part of Europe is agriculture more defective, nor the peasantry more idle and thoughtless, or so miserable and ill-disposed. What reply can be made to a statement, the truth of which is too notorious to be disputed? Simply, that to Irish farms are wanting certain conditions, without which no farms, whether small or great, nor their occupiers, can be expected to flourish. There are no bounds to the tenant's liabilities, and no security against his ejection. That Irish holdings should have been supposed capable of furnishing any argument against peasant properties, is only one among many examples of the profound

ignorance which prevails respecting Irish affairs. Ireland is one of the few countries in which there neither are, nor ever were, peasant properties. From the earliest appropriation of the soil, down to the present day, estates have always been of considerable size, and though these estates are now cut up into many small holdings, the actual occupiers of the soil, far from being landowners, are not even leaseholders, but are rackrented tenants at will. In this single phrase may be found a complete explanation of all the evils of their condition, and all the defects of their character. They are indolent, because they have no inducement to work after they have obtained from their labour wherewithal to pay their rent, and to save themselves from starvation. Whatever additional produce they might raise, would only subject them to further exactions. They are careless of the future, because they cannot, by taking thought, improve the gloomy prospects of the morrow; they are reduced to the verge of destitution, because they are permitted to retain no more of the fruits of their labour than will barely suffice for their subsistence; and they set at naught all other laws, divine or human, partly in obedience to the first law of nature, that of self-preservation, and partly because familiarity with misery has rendered them desperate.

Before we proceed further, it may be well to

inquire how it is that Irish cottars are unable to make better bargains with their landlords. In other countries, in which the property of the soil is not vested in the peasantry, the latter nevertheless obtain possession of it without submitting to terms altogether unreasonable. Leases may not perhaps be granted to them, but they do not suffer the landlord to fix his own rent. They will not consent to pay more than the land is worth, as a means of employing their capital and labour. But in Ireland they do not venture to reject any demands, however outrageous. Whatever rent may be asked, they readily agree to pay, perfectly heedless whether they shall be able to fulfil engagements which the necessities of their situation leave them no choice but to undertake. In a country in which farms are in general too small to afford employment for hired labour, a peasant has scarcely a chance of being able to gain a livelihood, unless he obtain possession of land; and in Ireland the competitors for land are so numerous, that the price paid for the use of it has reached a degree of exorbitancy unheard of elsewhere. Such keen competition clearly shows that population is excessive; that is to say, that the labouring class is too numerous in proportion to the amount of employment for it; but it would be a mistake to regard this redundancy of population as a consequence of the prevalence of small farms. The

progress of population has, indeed, been extraordinarily rapid since the period when nearly the whole territory was given up to pasturage, and since the immense grazing farms, by which it was formerly occupied, have been brought under tillage, and divided amongst more than half a million of cottage holdings. But population, in becoming more dense, has not, perhaps, become much more excessive. Ireland was certainly never before so populous as at present; that is to say, it never before contained so great a number of inhabitants, but it has long, perhaps, been nearly as much overpeopled; that is to say, the number of inhabitants has long been nearly as much disproportioned to the means of subsistence. The prodigious strides which population has made of late years, have made the destitution of the poor more obvious than before, but it is doubtful whether they have rendered it much more severe. The mass of the people has always been subjected to such extreme privations, that although the number of sufferers is now far greater, the sufferings of individuals have not been much aggravated. A very hasty retrospect may serve to discover the grounds for this opinion.

From the earliest times Ireland has been noted for the excellence of its pastures. Its level surface, overspread with the most luxuriant herbage, presented a wide field over which the cattle of the

first settlers might freely range and multiply at an exceedingly rapid rate. Their owners became proportionably wealthy, but the possession of great wealth by individuals implies a corresponding disparity of ranks in the community. The authority of the leader of a tribe may have depended on his personal character or on accidental circumstances, but whatever may have been the political position of the chief with respect to his fellow-herdsmen, the latter, no doubt, exercised almost unlimited power over their servants and dependents. It is, indeed, a recorded fact, that these retainers did, after a while, degenerate into absolute bondsmen, who were attached to the manor on which they dwelt, and, under the name of "betages," were as completely at the disposal of their lords as the serfs of Continental Europe. The pastoral occupation of the primitive Irish was not laid aside as soon as they had divided their new country amongst them, and had stationed themselves on particular spots, but continued to be practised by their descendants for many generations. The principal obstacle to change was, probably, at first, the nature of the climate, which, Mela says, was as unsuitable for grain as it was favourable to the growth of grass;\* and this was, perhaps, the sole reason why, so late as the twelfth century, the people could still be represented as

\* Pomp. Mela, de Situ Orbis, lib. iii. cap. 6.

despising husbandry, and as not having laid aside their ancient pastoral mode of life.\*

When greater intercourse sprang up between them and more civilised nations, they would have been taught the advantage of cultivating the soil; but, unfortunately, in the long period of anarchy which succeeded to the conquest by Henry the Second, the incessant warfare between the English colonists and the natives acted as an effectual bar to agriculture, for both parties thought it wiser to keep their property in the shape of flocks and herds, which could easily be removed to a place of refuge, than in corn stacks or standing crops, which must have been left to the mercy of a successful invader. Cattle thus continued to be the principal produce of the country, so much so, indeed, that they were often used as a medium of exchange, and that, even in the beginning of the sixteenth century, the Book of Ballymote is said to have been purchased for 140 milch cows.† More than a hundred years later, we find the poet Spenser lamenting that “all men fell to pasturage and none to husbandry,” and recommending that an ordinance should be made to compel every one who kept twenty kine to keep one plough going likewise.‡

\* “*Gens agriculturæ labores aspernans, a primo pastorali vivendi modo non recedens.*”—Giraldus Cambrensis apud Moore, *Hist. of Ireland*, vol. i. p. 317.

† Moore, vol. i. p. 191.

‡ Spenser's *View of Ireland*, Dublin, 1763, p. 230.

It is not likely that agriculture made much progress during the reigns of Elizabeth and of the first two Stuarts, and during the Protectorate, a period marked by the rebellion of the Earls of Tyrone and Tyrconnel, the massacre of the Protestants at the instigation of Roger Moore, the equally bloody invasion of Cromwell and the confiscation of five-sixths of the island ; and, if it did, it must have been thrown back as much as ever after the Revolution of 1688, when a twelfth of the land again changed masters ; and in the reign of Queen Anne, when a series of penal acts was directed against the Roman Catholics. These atrocious laws, amongst other monstrous provisions, forbade papists to purchase lands, or to hold them by lease for more than thirty-one years, or to derive from leasehold property a profit greater than one-third of the rent. The great majority of the people being Roman Catholics, were thus, in effect, restrained from the practice of agriculture, and the proprietors of estates had really no option but to let them to the few capitalists who could legally compete for them, and who could not, of course, properly superintend the management of the immense tracts which fell into their hands, except by keeping them almost entirely under grass. So general and so prolonged was the neglect of tillage, that, in the year 1727, a law was made to compel every occupier of 100 acres to

cultivate at least *five* acres ; but the injunction seems to have been little regarded, and, until about forty years later, little additional land was brought under the plough.

From the earliest times then, until late in the last century, Ireland was almost entirely a grazing country. Now it is true that in pastoral communities which have little commercial intercourse with more civilised nations, every class of persons is commonly sufficiently supplied with the necessities of life. In such circumstances, a rich herdsman has literally no means of getting rid of his superfluous wealth, except by maintaining a large retinue of servants, and he is naturally liberal enough of the milk, cheese, flesh, hides, and wool, which would be wasted if he did not give them away. But Ireland, from a very remote period, has carried on a considerable export trade, and the owners of the soil have always possessed in foreign countries a market for their surplus produce. It was therefore the interest of the primitive Irish herdsmen to restrain the consumption of their servants, and to confine it within the narrowest possible bounds. When the servants became serfs, they were not, according to the custom in more agricultural countries, provided with portions of land to cultivate for their own support : for the estates of their lords, however extensive, could scarcely be too extensive for pasturage. They lived

on such fare as their masters chose to provide, went half-naked, and slept under trees, or the scarcely better shelter of branches cemented together with mud. When they became enfranchised, they gained nothing but personal freedom. Their condition in most other respects remained unchanged. Froissart describes them as living in forests in huts made of boughs, like wild beasts.\* There was so little demand for labour, that most were still glad to serve for a bare subsistence, and the few who were permitted to be tenants of land, obtained little more from their farms. "Irish landlords," says Spenser, "do not use to set out their lands in farm, or for terms of years, but only from year to year, and some during pleasure; neither indeed will the Irish husbandman otherwise take his land than so long as he lists himself. The reason hereof is, that the landlords used most shamefully to rack their tenants, laying upon them coigns and livery at pleasure, and exacting of them besides his covenants what he pleaseth." Spenser goes on to speak of the farmhouses, which he calls "rather swine-styes than houses;" and of the farmer's "beastly manner of life, and savage condition, lying and living together with his beasts in one house, in one room, in one bed, that is clean straw or rather a foul dunghill." †

\* Johnes's Froissart, Edition of 1839, vol. ii. p. 578.

† Spenser. View of Ireland, pp. 125-7.

Matters were not at all mended in 1672, when Sir William Petty made his survey, and estimated that out of 200,000 houses then existing in Ireland, 160,000 were "wretched, nasty cabins, without chimney, window, or door-shut, even worse than those of the savage Americans."

From these premises it may be inferred that the present misery of the Irish peasantry is of no recent origin, but has been from time immemorial an heirloom in the race. The number of labourers has always been greatly in excess of the demand for labour, and the remuneration of labour has consequently never been much more than sufficient to procure the merest sustenance. This was as much the case when Ireland was one vast grazing farm, and contained few inhabitants beside cattle and their attendants, as now, that the face of the country is cut up into potato gardens, and dotted with cabins, each containing a separate family. The inhabitants have always been as numerous as the country in its actual circumstances could support, and population has only advanced in proportion as the limits set to it have been widened. How much soever population may have varied in amount at different periods, it has always been nearly equally in excess of the means of subsistence; and the multiplication of the people, much as it has increased the mass of misery, has not perhaps sensibly aggravated the misery of

individuals. The chief difference is that, whereas people were once starving on a short allowance of meat, they are now starving on a short allowance of potatoes. Abundance of the former they never knew, nor of the latter, except during one short period. This brief interval of comparative plenty commenced soon after the middle of the last century, when the increase of tillage increased the demand for farm servants ; but the increase was too gradual to produce any material or permanent effect. In the year 1762, the Irish parliament granted high bounties on the inland carriage of grain, and in 1783 and 1784 granted further bounties on its exportation, and prohibited its importation from abroad ; and the rise of price which took place in consequence was further promoted by the demand for foreign corn in Great Britain after the commencement of the war with France, and by the abolition in 1806 of all restrictions on the corn trade between this country and Ireland. Inducements were thus given to landholders to substitute tillage for pasturage, and as the tracts held by single graziers were in general much too extensive to be cultivated by the actual tenants, they were divided into farms of more convenient size, and let to such persons as were willing to undertake them. There was not, however, capital enough in the island to meet the requirements of this revolution in husbandry, and most of the new

race of farmers were so poor that they could not pay their labourers in any other way than by assigning to them pieces of ground to build cabins upon, and to cultivate for their own subsistence. Together with the farmers, therefore, a considerable body of cottars sprung up, and in this manner the bulk of the peasantry were converted into occupiers of land; but the conversion was effected much less suddenly than is commonly supposed. Although the inland carriage bounty caused a good deal of pasture to be broken up in a few counties, yet, after it had been several years in operation, the proportion of tillage to pasturage over the whole island was still not more than one to ten; and it is certain that the Acts of 1783 and 1784 caused only an inconsiderable tract to be brought under the plough. The increase in the exportation of grain, which may be regarded as an exact measure of the increase of cultivation consequent upon those Acts, shows that the latter was inconsiderable. The quantity of corn exported from Ireland was 211,979 barrels in 1783, and 648,884 barrels in 1789, showing a difference in six years of 436,905 barrels, or about 266,000 quarters; and this quantity divided by six gives about 44,000 quarters as the annual ratio of increased exportation. But to produce 44,000 quarters of corn, not more than 20,000 acres can have been required, and nine hundred men are many more than are commonly

employed to cultivate 20,000 acres in the ordinary manner. In each of the six years, then, ending with 1789, additional employment was created for no more than nine hundred labourers, at the very outside. But such an increase of employment in the midst of a population of nearly four millions, could not materially raise the price of labour, nor enable the peasantry to live much better than they had always been accustomed to do. The usual rate of wages was sixpence a day, but after the necessary deductions for Sundays, holidays, and bad weather, there remained only about 270 working days in the year, and of these the labourer was generally obliged to give up 60 to his master in payment for his cabin and garden, and 60 more in payment for the grazing of a cow. His actual cash receipts were therefore not more than three pounds fifteen shillings. His allotment of land, which was generally an acre or an acre and a half, might indeed have supplied the deficiency of his money wages ; but as it was held at will, and as the extent was regulated by the slovenly mode of tillage commonly practised, the rent would no doubt have been raised if the tenant had made the land more than ordinarily productive. He only troubled himself, therefore, to obtain from it as many potatoes as he needed, and with these, and with milk, he was, at that period, abundantly supplied, insomuch that Arthur Young

was struck with the contrast between the scanty meals of an English cottager, and the exuberance of an Irishman's potato-bowl, to which every member of his family, wife, children, pig, and poultry, enjoyed free access. Plenty of food was however the sum total of the Irish peasant's advantages, even in this, his short age of gold. While revelling at a succession of potato feasts, his clothing was little else than rags, and his cabin was the same miserable hovel as at this day, consisting generally of only one room, without chimney or window, and with walls, which, if artificial, were built of mud and straw, but which were sometimes merely the sides of a broad ditch, united at the top by a roof of thatch or sods overgrown with weeds, on which the pig might sometimes be seen grazing.\* Thus the increased remuneration of the labourer did not raise his standard of comfort by enabling him to procure new enjoyments and to satisfy new wants, but merely gave him an ample meal, and enabled him to feed his children better. The addition to the resources of the peasantry was just sufficient to give a fresh impulse to population, which advanced so rapidly, that although the extension of tillage continued to increase the demand for labour, the supply of labourers fully kept up with it, and prevented it from working any beneficial change

\* Young's Tour in Ireland, vol. ii. App. pp. 25-7.

in the condition of the people. The partition of grazing farms, and the creation of cottage holdings, enlarged the field of employment; but the enlargement was effected so gradually, that time was allowed for the number of seekers for employment to increase in the same proportion, and the same keen competition raised the rent of land which had formerly depressed the rate of wages. Thus, from the very first, land was procurable by the peasantry only on terms which forbade their deriving any benefit from the possession, and to this defect in their original tenure may be ascribed all the evils which have resulted from the introduction of the cottage system into Ireland. Population could not indeed have reached its present amount but for the general distribution of land among the peasantry; but neither would it have done so, if the peasantry had obtained the land on advantageous terms. If their conversion into landholders had sensibly improved their condition, the benefit would probably have been permanent, for their indigence and their improvidence would have been cured by the same means. From the peculiar manner in which the change was brought about, it failed to relieve that ancient and inveterate poverty which is not less the cause than the effect of the redundancy of population in Ireland, or it would probably have produced effects the very opposite of those which have actually proceeded from it, and

would have established the prosperity of the peasantry on a firm basis, instead of merely increasing the number of participators in their misery.

It is a conclusive proof that the occupation of land by the Irish peasantry does not of itself contribute to their misery, that it is precisely where the distribution of land amongst them is most general that population is least redundant, and the condition of the people most tolerable. In Ulster, the number of farms not exceeding five acres in extent, and the proportion of inhabitants occupying land, are greater than in any one of the other three provinces; yet in Ulster, the competition for land is less keen than in the rest of Ireland, and in Ulster only is the English tourist occasionally reminded of the happiest parts of his own country, by the comparative neatness of the white-washed cottages, and by the appearance of the comparatively well-dressed and well-fed inmates. It is true that Ulster is the most densely-peopled portion of the whole island, but population has not outrun subsistence in the same manner as in the other provinces, and the inhabitants, though much more numerous, have long preserved the same proportion between their numbers and their means of livelihood. The reason of this is, that they have always enjoyed something approaching to a comfortable subsistence. The terms of their tenure of land do not leave them just so

much only of the produce as may suffice to keep them from starving. They are not mere tenants in the ordinary sense of the word, but possess a proprietary right which limits that of the landlord, and restrains his power of raising the rent, or ejecting the actual occupant. This "tenant-right," as it is called, which is peculiar to the north of Ireland, has probably grown out of the privileges conceded to the English and Scottish emigrants, by whom Ulster was colonised in James the First's reign, to induce them to settle in so barbarous a region. Although founded solely on prescription, its operation is almost as effectual as if it were recognised by law, and its value to the possessor is self-evident. It stimulates him to exertion by securing to him the entire produce of his additional labour, and enables him to procure some few of the conveniences as well as the mere necessities of life. The natural desire to retain these advantages is only another name for prudence. A cottar's sons possess still greater facilities in Ulster than in Munster or Connaught for dividing their father's holding, yet they have long been much less in the habit of effecting such a partition. If they saw that they could not maintain themselves on their respective shares without sacrificing the few comforts they had been accustomed to, they naturally sought for some other means of livelihood. The cottage farms have con-

sequently been transmitted from one generation to another without diminution,\* and the agricultural population has advanced only in proportion to the increase of means for its support. The only county in Ulster to which this description does not apply is Donegal, in which, as the indigenous Celtic inhabitants were never extirpated, tenant-right has not been introduced except partially, and in an imperfect shape. The peasantry of that county, ever since they became occupiers of land, have been kept as poor as their brethren in the most wretched districts of Connaught, and their numbers have increased as fast, and the partition of their holdings has been carried to the same extent.

If it be objected that the prosperity of Ulster is, after all, only relative, and that anywhere but in Ireland it would receive a very different name, it may be replied, that tenant-right is a very inadequate substitute for the protection of leases or ownership. It has no legal sanction, but derives all its validity from custom ; and, having grown up by slow degrees, was no doubt at first stoutly contested by those to

\* In the north of Ireland, Arthur Young, in 1776, found that ten acres were considered a large farm, and five or six a good one (*Tour*, vol. ii. App. p. 21). Farms had been reduced to that size because the tenants, being rather weavers than farmers, required no more land to furnish them with a competent livelihood ; but having once reached that limit, they did not afterwards fall below it, being at this day quite as large as they were seventy years ago.

whose pretensions it was opposed. If, wherever even this imperfect security exists, the condition of agriculture and of the peasantry is far better than in other parts of Ireland, may it not be fairly concluded that, with more complete security, the superiority would be proportionably more striking? Is it not likewise reasonable to suppose that, in order to place the peasantry of the other provinces on a level in all respects with those of Ulster, nothing more is required than the concession to them of equal rights? Yet with these grounds for presuming that the small farm system of Ireland needs only to be modified in order to become a source of national prosperity, nothing short of its utter abolition is insisted on. The consolidation of small farms is continually declared to be an indispensable preliminary to the improvement of Irish agriculture, or to the regeneration of the Irish people. This sentence is surely somewhat arbitrary. The present race of cottars, exhausted and disheartened by merciless exactions, and liable as they are to have their rents raised, or to be themselves ejected at a moment's notice, are confessedly, for the most part, wretchedly poor and shockingly demoralised. The fact is decisive against rack-rents and tenancies-at-will; but does it prove anything against small leasehold farms, or small properties? Because small farmers cannot thrive without security of tenure, therefore security of

tenure is to be refused them. Why not add, that because hunger cannot be appeased without food, therefore a hungry man should not be permitted to eat ?

Not only, however, are not small farms the cause of Irish misery ; not only is their preservation quite compatible with the improvement of Ireland ; their continuance (though on a different tenure), and a considerable increase to their number, are perhaps the only means by which the manifold disorders of that country can be radically cured. Whatever may have been the original source of the wretchedness of the Irish people, its proximate cause is evidently a deficiency of employment ; the supply of labour so greatly exceeds the demand, that multitudes have not adequate means of gaining a livelihood. This being the nature of their present distress, no scheme for its relief can have complete success which does not furnish them with adequate occupation, and it may not be difficult to show that for the agrarian population of Ireland, adequate occupation cannot be afforded except on small farms. This will appear from a hasty examination of the various schemes proposed. By a large class of reasoners, the deficiency of employment is held to be a necessary consequence of deficiency of capital, and to be incapable of being supplied except by the introduction of additional capital ; and as capital will not enter a

country in which life and property are unprotected, the first step towards improvement is declared to be the repression of that spirit of outrage which makes Ireland the terror of all who have anything to lose. For this purpose, either coercion or conciliation may be tried. But four or five millions of famishing desperadoes must be almost exterminated before they can be dragooned into loyalty. If force only is to be used, force must create a solitude in order to establish peace. Still less can be expected from conciliation, if by that term be understood merely the redress of political grievances. Most of these causes of complaint have already been removed, without removing anything of that bitterness of feeling which they were supposed to have engendered, and the redress of the monster grievance which remains, however desirable on other accounts, would assuredly not have a much more soothing effect. Should the church of the majority be at once reinstated in her ancient position, and again endowed with the wealth of which she has been plundered, her clergy would be almost the only gainers. The mass of the people would remain as destitute as ever, and would have as little reason to submit quietly to their dismal lot. The priests, indeed, when in the receipt of liberal stipends, and when no longer dependent on voluntary contributions, would have no motives for affecting to sympathise with the evil passions of their hearers,

and would rather exert themselves for the maintenance of order. Their influence has, however, been exceedingly overrated. With a few disgraceful exceptions, the Roman Catholic clergy are not accused, even by their most virulent calumniators, of openly countenancing violence. Many have used their utmost efforts to allay the evil passions of the people, and almost all are so far mindful of their sacred obligations as to remain at least quiescent: if they do not labour very earnestly to prevent crime, they do not directly encourage it. In truth, such encouragement would be superfluous. Where the materials for spontaneous combustion exist in such abundance, no torch is needed to kindle them. The flames burst forth as freely without any extraneous aid. The outrages by which life and property are endangered in Ireland, result naturally from the wretchedness and desperation of the people. The law is disobeyed because, to the multitudes who have nothing to lose, it affords no protection, while it withholds from them everything they covet. Self-preservation is the first law of nature, and they who cannot keep their lives by any other means, must fight for them. To an Irish cottar a writ of ejectment is equivalent to a sentence of starvation, and he not unnaturally endeavours to retain possession of his land by sending a bullet through the head of every competitor. It is the fear of destitution that

goads him on to crime. In such a temper he is doubtless more easily led away by factious demagogues, and more morbidly alive to national insults ; but, independently of such additional excitement, he finds in his own reflections but too many stimulants to aggression and assassination. As, then, the lawlessness of Ireland does not originate in priestly instigation, so neither could it be repressed by priestly authority. As long as the peasantry continue on the verge of starvation, the most persuasive eloquence will fail to keep them quiet. There will be no peace, even though the priests take upon them the office of peacemakers. Their counsels will be disregarded until their hearers are tolerably fed, and that cannot be until work is found for such as require it. For this first essential, no conceivable substitute can suffice. Education would avail as little as clerical authority ; it could neither give the people food, nor reconcile them to the want of it. Poor-laws may possibly be mentioned as providing for the first of these alternatives ; but poor-laws create nearly as much distress as they relieve. What they give to one section of the labouring class they take from another ; whatever is levied for poor-rates is subtracted from wages. Besides, the gratuitous maintenance of one-third of the Irish people cannot be seriously proposed. A compulsory provision for the poor must be intended to have only partial operation,

and to be combined with measures which shall enable the great mass of the poor to earn their own livelihood. But such measures, it is said, require additional capital. If so, we have before us a complete circle of difficulties, impregnable at every point. The country cannot be tranquillised until the people are employed, nor the people employed until capital be introduced, and capital will not enter until tranquillity be established. So that the end proposed must be accomplished before the requisites for its accomplishment can be procured !

But it may be urged, that although private speculators are unwilling to venture their money in such a country as Ireland, capital might be introduced by government, and expended on public works—in the construction of roads, railways, canals, and bridges, in drainage, or in the embankment of rivers. Such measures might be adopted with a view to two distinct objects. The first and most obvious would be that of affording facilities for the development of the resources of the country ; but it might also be expected that the works, while in progress, would furnish occupation for the multitudes who had been previously unemployed. We need not stop to inquire whether the enormous expenditure requisite for this purpose would be incurred by any government. Undeterred by this, or any other objection, let us suppose, for the sake of argument, that government

had undertaken to provide occupation for all who required it ; that the peasantry were all in the receipt of good wages, and either too busy, or too well pleased at being paid for idling to think of mischief ; and that, tranquillity and confidence having been established, British speculators had crossed the Channel, with as large an amount of capital as the country could absorb. In what manner could this capital be applied ? Partly, perhaps, in fisheries and manufactures ; but the former could not afford regular occupation, except to the inhabitants of the coasts ; and the latter do not seem to attract surplus hands from other occupations, but rather to encourage the growth of a fresh population for themselves. A future generation of Irishmen might perhaps consent to become operatives, but the existing race would exclaim as loudly against being shut up in factories as in workhouses ; and even if they were more tractable, no manufacturer would think of engaging, for his delicate machinery, hands that had only been used to the spade and pickaxe. The only occupation suited to an agricultural population is agriculture ; and if the Irish peasantry are to be adequately employed, they must be principally employed in farming. Let us suppose, then, that the greater part of the newly-imported capital had been entrusted to scientific agriculturists, who, overcoming all the obstacles which have hitherto impeded

such operations, had removed the present class of cottars, and, consolidating their holdings, had divided Ireland into farms of the same size as those of England. Let us next calculate what proportion of the peasantry could obtain employment on these enlarged farms. The extent of land in Ireland, either already cultivated, or capable of cultivation, may be stated at eighteen millions of acres, which, at the rate of one person for every twenty-eight acres,\* the proportion usual in England, would furnish work for 642,000 male adults. But of one million and a half of families, constituting in 1841 the entire population, nearly one million were chiefly engaged in agriculture; and of 2,400,000, the total number of male adults, 1,600,000 were similarly engaged. When, therefore, the new farms had absorbed all the labour they required, there would remain nearly 600,000 families, comprising three millions of individuals, who, after the termination of the works undertaken by government, would be without work of any kind. The revolution effected in agriculture would have deprived them of their former occupation, and manufactures, as we have seen, would offer them no resource. It is true, that those who recommend the extinction of the cottage system, and the adoption in Ireland of the English mode of farming,

\* This is the proportion of land to male adult labourers; but of agricultural labourers of both sexes and of all ages, there is one for every twenty-four acres, as stated at p. 8.

acknowledge that those measures must be accompanied by others for the promotion of emigration, and are not dismayed even by the necessity of transporting across the Atlantic, a colony of two millions of human beings. The eminent names appended to a recent scheme for that purpose, and the ability with which it is drawn up, forbid its being mentioned otherwise than in terms of respect ; but it may, without disparagement, be pronounced of too startling a character to be adopted by any government without much more mature deliberation than the urgency of the case will allow time for. The plan of improving the condition of the Irish peasantry by the consolidation of farms might therefore be at once rejected, if only on account of its requiring, as supplemental to it, a scheme of emigration on so vast a scale.

There remains no resource but that of small farms. So far as Ireland is concerned, the question is not whether small or large farms are preferable, abstractedly considered. The former do actually predominate, and have raised up a population for which they alone can furnish occupation ; to what objections soever they may be open, their abolition is nevertheless impracticable ; if they be an evil, they are a necessary evil, and the only wise policy is to make the best of them. Subjoined is a table, showing the distribution of the cultivated area, and of the agricultural population of Ireland :—

Cultivated Area in Statute Acres.																						
Number of Families chiefly employed in Agriculture.																						
Total Number of Persons holding land.																						
Number holding not more than one Acre.																						
NUMBER OF PERSONS HOLDING MORE THAN																						
1 acre	2 acres	3 acres	4 acres	5 acres	6 acres	7 acres	8 acres	9 acres	10 acres	20 acres	50 acres	100 acres	200 acres	500 acres	1000 acres	2000 acres	3000 acres	4000 acres				
AND NOT MORE THAN

Number whose holdings are greater than 5000 Acres . . . 6      Number of Persons holding in Joint or Common Tenancy . . . 30,433

N.B.—*This Table is altered from one inserted in Captain Kennedy's most able Digest of Evidence on Occupation of Land in Ireland—a work which cannot be too carefully studied by all who would obtain a knowledge of the actual state of that unhappy country.*

This table shows, that of 974,000 agricultural families, only 40,000 are altogether without land, and that more than 500,000 occupy farms of eight acres or upwards. Eight acres are quite enough to enable a tenant family, paying a fair rent, to obtain a competent maintenance; so that occupiers of this class, in order to be enabled to thrive, require only a secure tenure, or, in other words, the security of leases, with such conditions as would ensure to them a fair remuneration for their expenditure of money and labour. Without such leases, wherever the cultivators are not owners of the soil, it is impossible that agriculture can flourish; and wise landlords are as ready to grant as tenants are anxious to receive them; but landlords in general are short-sighted judges of their own interests, and with the view of quickening their perceptions, it has been proposed to make rent irrecoverable without a lease. The late Mr. O'Connell, by whom this expedient was recommended,\* acknowledged it to be a violent remedy; but a more serious objection is, that it would probably have little effect upon the disease. The value of leases depends entirely on their provisions; and the Legislature, although it

\* Arthur Young had long before suggested, as a necessary step towards improvement, that "the meanest occupier should have a lease, and none shorter than twenty-one years." (Tour, vol. ii. App. p. 24.)

might require them to be granted, could not pretend to regulate the demands for rent, or the other conditions to be imposed upon tenants. Thus the only lease to which the landlord would consent, might be such as either the tenant would not accept, or such as would fetter without protecting him. As a substitute for leases, the propriety of establishing tenant right throughout Ireland has, of late, been a good deal discussed. If by the term be meant the qualified proprietary right enjoyed by the peasantry of Ulster, the beneficial effect which would result from its extension to the other provinces will scarcely be denied by an advocate for peasant proprietorship. The equity of such a measure is, however, a different question. The tenantry of the midland and southern provinces are, in general, tenants at will, removable at the landlord's pleasure; and to give them, with what conditions soever, permanent possession of land, which they previously held by so slight a tie, would be an invasion of the rights of property, from which even Stein and Hardenberg—the boldest innovators of modern times—would have shrunk, and which will certainly not be attempted by the statesmen of a country, in which reverence for vested interests is carried to the verge of superstition. If, on the other hand, nothing more be meant than that an ejected tenant should be entitled to compensation for substantial improve-

—would suffice for 200,000 allotments, of eight acres each.

The waste land of the best quality is, however, far from being fit for immediate cultivation. Some of it may only require to be pared, burnt, and limed, but much is bog or moor, which requires to be thoroughly drained, and to have the sub-soil mixed with the surface mould and with lime ; but these, and all other preliminary operations, might be performed at very little expense by the persons for whose ultimate benefit they were designed. The proposed grantees are at present without employment, and, unless some such measure as that under consideration be adopted, without any prospect of it. They are now, and they must continue for an indefinite period, to be supported at the public expense, and it would be much cheaper to keep them usefully engaged than to maintain them in idleness. It would therefore be good economy to take them forthwith into pay, and to employ them in draining and sub-soiling the wastes selected for reclamation. After the completion of these preparatory operations, the next step would be to mark off districts suitable for the settlement of collections of families, which would vary in size according as the colonies were intended to constitute separate village communities, or to be united to communities previously existing. Each district should be divided

into lots corresponding in number to the number of settlers, and the latter should be further required to construct a cottage, according to an approved plan, on every lot. Every family should then be placed in possession of one of the cottage farms, and be made perpetual lessee, at a fixed rent, and on certain other conditions, which will be more particularly described hereafter; and having been furnished with tools and some farming stock, should be instructed that, after the next harvest, they would have to provide for their support by their own industry.

Before we proceed to inquire what further measure would be necessary to ensure the success of this great social experiment, one or two apparent objections to it must be answered. One, which will occur to most minds, is the enormous expense which would be required. To maintain two hundred thousand families for many months, to purchase land for their occupation, and to supply them with materials for building, and with farming implements and stock, would certainly cost an immense sum. But the cost of an undertaking, however great, would not justify its rejection, provided its advantages could be shown to be commensurate, more especially if, as in the present instance, great part of the expenditure were inevitable in any circumstances, and if the further outlay were calculated to

prevent the recurrence of demands which would otherwise be perpetual. Two hundred thousand destitute families must be fed at the public expense, whether they be set to work or be suffered to remain idle, and must continue to be so fed until they are placed in a position to provide for themselves. The present cost of maintaining them is an annual tax, which must be levied until redeemed, and exemption from it would be cheaply purchased at many times its amount. At how low a price its removal might be effected in the mode indicated above, will appear from an examination of the various items of expense.

It would be necessary, in the first place, to buy up the proprietary rights possessed by private persons over the waste lands required. Of the perfect competence of the Legislature to enforce the sale of such rights, there can be no question. An authority which compels individuals to part with their most valued property, on the slightest pretext of public convenience, and which permits railway projectors to throw down manor-houses, and to cut up favourite pleasure-grounds, need not scruple to insist upon the sale of boggy meadows, or upland pastures, with the view of curing the destitution and misery of an entire people. But upon this point it is the less necessary to dwell, as the right of Parliament to dispose of the wastes has been asserted in the most

explicit terms by the first Minister of the Crown.\* The compensation to be made to the proprietors would depend on the present produce of the land. The average value of this cannot at present exceed two shillings an acre, so that two pounds an acre, equal to twenty years' purchase, would be a very liberal payment for the fee-simple. The expense of thorough drainage would scarcely reach 4*l.* an acre, and that of sub-soiling would not exceed 30*s.*† A cottage, with its appurtenances, suitable to a farm of eight acres, might be built for 40*l.*;‡ and the farmer, on entering, might manage to get on without an advance of more than 20*l.* The whole outlay may, therefore, be stated as follows :—

Purchase of 1,600,000 acres, at 2 <i>l.</i> per acre	. £3,200,000
Expense of drainage and sub-soiling, at 5 <i>l.</i> 10 <i>s.</i>	8,800,000
Construction of 200,000 cottages, at 40 <i>l.</i> each	. 8,000,000
Advances to 200,000 cottiers of 20 <i>l.</i> each	. 4,000,000
	<hr/> £24,000,000

From which must be deducted the cost of maintaining 200,000 families, or 1,000,000 individuals, for the two years during which the operations might be expected to last. This, at 5*l.* per head, would be 5,000,000*l.* annually, or for two years, 10,000,000*l.*; which, subtracted from 24,000,000*l.*, would leave 14,000,000*l.* At this low price, less than three years'

\* Lord J. Russell's Speech on the State of Ireland, Jan. 25th, 1847.

† Digest of Evidence on Occ. of Land, pp. 82-3.   ‡ Ibid. p. 139.

purchase, the public would be relieved from the necessity of an annual payment of 5,000,000*l*. The operation, viewed merely as a financial feat, would establish the reputation of the minister by whom it was achieved. The transfer to the waste lands of the destitute portion of the Irish peasantry has here been treated as the only feasible scheme for placing them in a satisfactory position, public works of other descriptions, as well as emigration, having been previously examined, and rejected as incapable of effecting the grand object. Otherwise the reader might be reminded that, according to the estimates of Mr. Godley, the transport to Canada of 200,000 families would occasion a certain loss of 6,000,000*l*., and a possible loss of a still larger sum ; and that not many months ago one hundred and eighteen members of the House of Commons were ready to vote sixteen millions sterling for the prosecution of a Railway project, which at best could only be expected to improve the condition of the people by preparing the way for measures calculated to benefit them more directly. Besides, the expenditure on the waste lands is not to be regarded as money irrecoverably sunk, but rather as a loan to the settlers, who should be required to pay interest upon it. Five per cent. upon fourteen millions sterling, payable by 1,600,000 acres, would be something less than nine shillings an acre, a very moderate rent to be paid by the

perpetual lessee of a farm, with a substantial dwelling upon it.

These anticipations of profit may certainly be not unreasonably pronounced somewhat premature, inasmuch as they take for granted the complete success of an experiment of which many persons would as confidently predict the total failure. The fact of land having been suffered to lie waste up to this time has been cited as a proof of its being unworthy of improvement; if it had promised a fair return for the application of capital, capitalists, it is said, would not have delayed so long to avail themselves of it. To this it may be replied, that most of the resources of Ireland are acknowledged to have been as yet only very imperfectly developed, in consequence either of the poverty or of the apathy of the people: to these causes are owing the neglect of mines and fisheries, and the backward state of agriculture; and it would be only reasonable to account for the neglect of the wastes in the same manner, instead of ascribing it to their inherent worthlessness. Besides, the classification of the wastes adopted in the preceding pages is not founded upon doubtful estimates, but is the result of careful investigation, by an engineer of the highest eminence, Mr. Griffith, the general valuation commissioner. This gentleman is so little disposed to an extravagant appraisement, that he condemns considerably more than three-fourths of

all the wastes, as either unimprovable, or as only improvable for pasture; yet, even after this large deduction, there remains of superior quality nearly enough for the home colonisation proposed above. The land of this superior description is represented as capable of being prepared for tillage, at an expense which its increased value would fully repay, and the opinion coming from an authority of so cautious a character, might, even if otherwise unsupported, be accepted without much hesitation.\* An attempt will presently be made to prove that it is correct, but let it in the meantime be supposed to be erroneous. Let it be supposed that even the best of the waste lands would never yield any rent, and that it would be necessary for the settlers to be placed in possession of their farms not as lessees, but as absolute proprietors. Even in that case the money expended in preparing the land for their occupation, in drainage and subsoiling it, and in buildings, would have been most advantageously laid out, provided only the settlers should thenceforward be enabled to provide for their own subsistence. Even this partial success would be

\* Upon *mountain wastes*, as all wastes in Ireland, that are not bog, are called, "is to be practised," says Young, "the most profitable husbandry in the king's dominions, for so I am persuaded the improvement of mountain land to be." (Tour, vol. ii. App. p. 69.) And again, "no meadows are equal to those gained by improving a bog; they are of a value which scarcely any other lands give rise to. In Ireland, I should suppose, it would not fall short of forty shillings an acre, and rise in many cases to three pounds." (Ibid. p. 74.)

a sufficient recommendation of the scheme. There would be little cause to regret the outlay, even though it should do no more than raise two hundred thousand families from destitution to independence; should relieve the rest of the peasantry from the ruinous competition which now depresses them; and should, at the same time, absolve the public from the necessity of an annual payment of more than one-third its own amount.

Whatever doubts may be entertained of the realisation of these results must be of one of two kinds. It must be supposed either that the land, after every preliminary improvement, would still not repay even the current expenses of cultivation, or that the cultivators would not properly avail themselves of their advantages. Now, when land is said to be not worth cultivating, the meaning is, that the produce would not afford to the capital and labour employed so large a return as they might obtain, if otherwise applied. It is not necessary to inquire whether the Irish wastes are of this character, for the only capital of the colonists, whom it is proposed to transfer to them, is labour, and that labour for which there is no demand, and which, consequently, has no market value whatever. Unless employed upon the waste lands, it cannot be employed at all—there are no other means whatever of turning it to account; how small soever may be its produce, that produce is all

clear gain, which could not have been acquired in any other manner. The question is not whether if otherwise employed, the colonists might not have obtained a larger remuneration, but whether, in the only occupation open to them, they are able to maintain themselves ;—whether the returns from the lands, given to them to cultivate, will be sufficient for their subsistence.

Now there is no land so poor that it may not be rendered fertile by artificial means. Its barrenness commonly arises from the deficiency of certain substances, which need only to be supplied in order completely to change its character. To procure the requisite ingredients might, perhaps, be a work of much time and labour, to pay for which might cost so much as to make the business anything but a profitable employment of money. But no such objection could apply, if none but spare and superabundant labour were used : the work, however tedious and toilsome, would then cost absolutely nothing. However great the expenditure of labour, none of it would be wasted, for the labour would only have acquired value by being so expended. No ground is so worthless that an English labourer will not eagerly accept an allotment of it for the occupation of his leisure, and that he will not speedily convert it into a productive garden, benefiting himself proportionably at the same time. Nor is it only

unmarketable labour that may be profitably employed in this manner. In long occupied and well-peopled territories, where wages are not extraordinarily high, and where good land is not easily procurable, it would seem that no soil can be so bad that a labourer, to whom it is granted in full property, will not find it for his interest to cultivate it, even though by so doing he should be obliged to neglect other employment. No soil can be imagined more unsuitable for vegetation than the sand with which the maritime provinces of Belgium were once overspread, and with which extensive tracts are still covered. It can be likened to nothing but the sand on the sea shore, which it no doubt originally was, and it offers about the same attraction for the investment of capital ; but although the rash speculator, employing hired labour, who should have undertaken the improvement of such land, would probably have been ruined, the attempt was made with the most complete success by moneyless boors, who, working on their own account, contrived to enrich both themselves and the soil, and, indeed, to make the latter the richest on this side the Alps. The conversion of sand into mould is not yet complete in Belgium, and the process may still be witnessed at every stage. In the first place, broom seed is sown, which will grow anywhere, and the plants from which are fit to be cut in three years, and are then sold for fire-wood to bakers

and brick-makers. The ground has acquired some compactness from the fibres of the roots, and has been enriched by the leaves which have fallen, and by the manure purchased with the price of the faggots. It is now in a fit state to be ploughed and to be sown with buck-wheat, or even with rye; and by the time this is reaped, a sufficiency of manure may be collected to allow of a regular course of cropping. As soon as clover and potatoes enable the farmer to keep cows, improvement goes on rapidly. In a few years the soil undergoes a complete change; it becomes mellow and retentive of moisture, and enriched by the vegetable matter afforded by the decomposition of the roots of the clover and other plants. The Flemings seem to want nothing but a space to work upon: whatever be the quality or texture of the soil, they will, in time, make it productive. It is deserving of remark, that their improvements, when once begun, are seldom abandoned, unless undertaken on too large a scale, in which case the land is soon divided into smaller portions, and improvements proceed from a greater number of centres, and with more certainty.\*

These examples may serve to show that there is no land not absolutely incapable of cultivation, of which the produce, though it may not yield profit enough

\* Flemish Husbandry, pp. 11—13.

to satisfy a capitalist, will yet not yield some profit—will not somewhat exceed the expenses of cultivation. In the expenses of cultivation is included the cultivator's subsistence ; there is, therefore, no land from which the cultivator may not obtain a livelihood. It is true that the Flemish process, just described, is somewhat tedious, and would be but ill adapted to cultivators who were entirely dependent for subsistence on the land they were reclaiming. It would by no means suit our Irish colonists, for instance, who might perish with hunger while their farms were producing only crops of brushwood. But neither would the adoption of so slow a process be requisite on the better sort of Irish waste land, which bears no sort of resemblance to the sands of Belgium. Much of it, even in its present state, is used as pasture, and the rest consisting of heathy bog, though at present valueless, has a surface of vegetable matter from one or two feet thick, resting generally on a bed of clay or gravel. The intermixture of the upper and lower soils will supply to each what the other principally wants, and this operation, as well as drainage, would be performed before the settlers were placed in possession of their farms. The latter, therefore, from their first occupation, would possess as high a degree of fertility as the soil of Belgium would acquire after several years of incessant labour. Indeed, with the addition of lime (or where lime were

not procurable, of sea-weed or sea-sand) they would immediately bear tolerable crops of roots. Of this experience affords abundant proof. The reclamation of waste land has been undertaken of late years, in several parts of Ireland, by private persons, and, as it would seem, with invariable success. Several instances are on record, of land naturally worth not a shilling of rent per acre, which, by draining, subsoiling, and liming, has in the first year been made to produce five tons of potatoes per acre, or corresponding crops of turnips, and in three years' time has been prepared for an ordinary five years' rotation, being then estimated to be worth a rent of 30*s.* or 35*s.* per acre. It is easy to show how a farmer, with a wife and three young children, might obtain a livelihood from eight acres of such land. Two acres, in the first year, would yield 300 bushels of potatoes (and two hundred would suffice for the consumption of the family), and the turnips, or other produce of the rest of the farm, would be much more than enough for the keep of a cow and a pig. By the end of the year there would be a considerable accumulation of manure, and it would be the farmer's own fault if the quantity did not annually increase, until every portion of his land had been brought into the highest state of productiveness of which it was capable. With abundance of manure at his disposal, all his difficulties would vanish. In the second year he

might substitute oats for potatoes, and, in every subsequent year, he might sow a considerable part of his land with some sort of grain. But even although he should make corn his principal article of diet, he would not, when his land was thoroughly fertilised, require more than two acres to produce food for the direct consumption of his family, so that six acres would remain under grass or green crops for his cattle. A Fleming, in such a situation, would be able to keep at least four cows, stall fed; and, as we are now considering what the land is capable of, we may assume that an Irishman would do the same. The milk and butter of one cow he might use at home, but the rest of the dairy produce might be sent to market, and no elaborate calculation can be needed to prove that the proceeds would enable him to defray all the expenses incidental to his station in life, and to save a good deal of money besides, even though he should not be absolute owner of his farm, but should be subject to an annual rent of nine shillings an acre.

It will have been observed, that potatoes form, as it were, the basis of the farming just referred to. They seem to be thought the only crop on which man can subsist, that in this climate can be obtained from newly reclaimed land without the assistance of manure,\* and to be, consequently, the only provi-

\* Young, however, from land which had been merely pared, burnt,

sions which pauper cultivators could raise during the first year. But after failing in two successive seasons, this crop can no longer be safely depended upon; and should the disease, by which it has been twice destroyed, be still continuing its ravages when the waste lands are prepared for tillage, a considerable alteration of plan will be necessary. The change will be a subject for regret, inasmuch as it will occasion a considerable increase of expenditure; but, on the other hand, its effect will be to hasten, by a year or two, the progress of improvement. One object of every scheme for the benefit of Ireland, and one sign of its success, must be the adoption of better kinds of food by the labouring classes. In attempting to raise the social condition of the people, some higher end should be proposed than that of enabling them to obtain a sufficiency of potatoes. If this only were aimed at, it would be quite unnecessary to allot so much as eight acres of land to a family. Farms of that size were recommended, in order that the occupants should be able to make bread their staff of life, and to grow grain enough for their consumption, as, in the course of two or three years, it was expected they would do. If, however, the potato disease prove permanent, the Irish peasantry must needs be fed on grain at once, and

and limed, took crops of wheat, rye, and bere, the first year. (Tour, vol. ii. App. p. 70.)

unless Government prefer to furnish the people with food, instead of enabling them to raise it for themselves, its simplest course will be to supply every settler on the waste lands with manure enough to prepare part of his ground for oats. His first harvest will then supply him with bread instead of potatoes, and this will be the principal difference, so far as he is concerned. His subsequent operations will be nearly the same as in the case previously supposed.

It may here be proper to show, that the management of eight acres of land will not be too severe a task for those on whom it is to be imposed, viz., for a family of five persons, including only one male adult, and possessing, besides their land and their industry, no other capital than the small advance made to them for the purchase of indispensable implements and stock. The head of such a family would not be able to procure either a horse or a plough, and would be obliged to use a spade; but this, as every one may see, by comparing a field and a garden, is by far the more efficient instrument when time will allow of its being used; and the only question is, therefore, whether one man could spare time for the spade work annually required on a farm of eight acres. A more than ordinary share would be necessary on waste land, during the first year or two after its reclamation, but still not more than could

be easily performed. "A good labourer can trench four perches (each perch being a square of five and a-half yards) in a day, or dig eight perches. It will take him thirty days to trench an acre, and sixteen to dig it well."\* If placed in possession of his farm in October, therefore, he could easily dig six acres before the season arrived for planting potatoes and sowing turnips ; and when a regular rotation of crops was established, his labours would be greatly abridged. Suppose him to appropriate three acres to corn, one to potatoes, one to clover, and one to turnips, and to keep two under grass. Between harvest and spring he must trench one acre twenty inches deep, and manure it for potatoes, and dig three acres ; one acre being under clover, sown with the corn of the previous season, will not require digging, and another will have been sufficiently prepared for wheat by the taking up of a former crop of potatoes. His spade work will occupy him only seventy-eight days, and he will have the rest of the year for wheeling manure, harrowing, sowing, planting, mowing, and reaping, while his wife and children weed the crops, tend the cows and pigs, and perform other light offices.

The whole amount of labour would be but a moderate burden for the united strength of the

\* Flemish Husbandry, p. 75.

family, whose own fault alone it would be if they did not prosper. But it is not sufficient to have shown what a mine of wealth lies hidden in the waste land, if there be reason to believe that it would not be properly wrought by the settlers whom it is proposed to place there. A colony of Flemings, in such a situation, would speedily bring the soil to the highest pitch of fertility, and enrich themselves with the abundant tribute they would extort from it; but Irishmen, it will be said, are not Flemings.\* The former would, indeed, have the same motives for industry. In their proprietary character, they would possess that strongest of all incentives to exertion, the knowledge that they were working for themselves; they would feel the influence of that affection for their little domains, which, according to Adam Smith, makes small proprietors "the most industrious, the most intelligent, and the most successful of improvers"—of that "magic of property," which, as Arthur Young says, "turns sand to gold."

\* Young has some remarks so singularly apposite, that it would be unpardonable not to insert them here. "A few considerable landlords," he says, "many years ago, made the experiment of fixing, at great expense, colonies of Palatines on their estates. They had houses built for them, plots of land assigned to each, at a rent of favour, assisted in stock, and all of them with leases for lives from the head landlord. *The poor Irish are very rarely treated in this manner, but when they are, they work much greater improvements than are common among these Germans.*" (Tour in Ireland, vol. ii. App. pp. 24, 25.)

Such impulses might be irresistible by ordinary mortals ; but Irishmen are apparently considered exempt from the rules by which mankind in general are governed. It seems to be thought that with them self-interest is less powerful than habit ; that having hitherto always lived in constrained inactivity, they now value no privilege so highly as idleness ; that having never possessed anything but the merest necessities of life, they have little desire for its comforts, or, at any rate, think them not worth the price of steady labour. What little employment is at present offered to them, either in their own potato grounds, or by larger occupiers, is often either neglected, or listlessly performed ; and it may be suspected that they would exhibit the same apathy, even if constituted owners of farms large enough to furnish them with constant occupation, more especially when those farms, consisting of land recently reclaimed, demanded more than ordinary assiduity for the development of their resources. In reply to this, reference might be made to the notorious fact, that Irish labourers, when removed to situations in which industry is liberally rewarded, exert themselves as strenuously as those of any other nation ; and even in Ireland examples are not wanting of peasants not only working hard, but applying themselves with ardour and success to the very occupation, their fitness for which we are now considering.

Young observed, long ago, that "little occupiers who can get leases of a mountain side, make exertions in improvement, which, though far enough from being complete, show clearly what great effects encouragement would have amongst them ;"\* and he adds, "that the idleness seen among them when working for those who oppress them, is a very contrast to the vigour and activity with which the same people work, when themselves alone reap the benefit of their labour."† Among the grounds for this estimate of the Irish character, was an experiment tried by Young himself. On Lord Kingsborough's estate he marked a road, and assigned portions of the waste on each side to such as were willing to form the fences in the manner prescribed, to cultivate and inhabit the land, allowing each a guinea towards his cabin, and promising the best land rent free for three years, and the worst for five. The eagerness with which the poor people came into the scheme, convinced him that they wanted nothing but a little encouragement, to enter with all their might and spirit into the work of improvement. They trusted to his assurance to go to work upon the ditches, and actually made a considerable progress. "In all undertakings of this kind in Ireland," he continues, "it is the poor cottars and the very little farmers

\* Tour, vol. ii. App. p. 22.

† Ibid. p. 72.

who are the best tools to employ, and the best tenants to let the land to ;”\* and this is confirmed by Mr. Nicholls, who says that “most of the recently reclaimed land which he saw in the western counties, was reclaimed by the small occupiers, who drained and inclosed an acre or two at a time.”† But the evidence taken by the Land Commission, being the latest, may also be considered the most valuable. A practice, we are told, not uncommonly adopted by Irish farmers, is, that of “giving a small piece of waste land to a poor cottar or herdsman, for the first three crops, after which the improved portion is returned to the farmer, and a fresh portion is taken on the same terms by the cottar. Here are persons of the very poorest class obtaining a livelihood by the cultivation of waste land, under the most discouraging and least remunerative circumstances that can well be imagined.” Where more favourable terms are conceded to the tenants, the progress of improvement is proportionate. On the Lough-ash estate, in Tyrone, about four hundred acres of waste land have been distributed among thirty tenants, most of whom have leases for twenty-one years, and obtained the land rent free for the first part of the term, on condition of paying a gradually increasing rent during the remainder.

\* Tour, vol. ii. App. p. 72.

† Nicholls's Reports on Irish Poor Laws, p. 18.

These tenants took possession of their respective allotments at different periods, between the years 1829 and 1840. They belonged originally to the "poorest class of cottars;" but when visited by the Land Commissioners, "had raised themselves into a comfortable body of farmers."\*

Examples of this kind may not, however, be numerous enough to establish a national reputation for industry, and it would no doubt be safer to assume that the energies of the Irish peasantry would require to be artificially stimulated. Without adopting the theory of the incorrigible laziness of the Celtic race, with which some writers perversely choose to stultify all their own suggestions for the benefit of Ireland, we may acknowledge it to be doubtful whether people who had been dawdling about all their lives, would, when regular occupation were offered to them, spontaneously apply themselves to it. There is certainly some reason to apprehend, that if settlers of this description were merely translated to their respective allotments, and there abandoned to their own devices, many of them might prefer sloth and poverty to toil and comfort; and, at any rate, no appeal to their hopes or fears, that might help to rouse them to activity, should be rejected as superfluous. Some direct attempts might be made to imbue them with new and

\* Digest of Evidence on Occupation of Land, p. 570.

improved tastes, and they should certainly be made acquainted with the advantages of their position, taught how to avail themselves of them, and threatened with their withdrawal in the event of their neglecting to make use of them. One advantage of having the houses on the reclaimed lands built under the superintendence of public officers, would be, that their occupants would receive at once tolerably exalted notions of one sort of comfort, of which they might long have remained ignorant, if they had been permitted to build dwellings according to their own fancy, and had taken for their models the vile styes with which they had previously been satisfied. In general, however, it is sufficient, in order to create new wants, that the means of gratifying them be provided. If the colonists could be made to understand, that by taking a little pains they could procure good clothes and good food, they would quickly discover that a whole coat is better than rags, and that a dinner of potatoes would be immensely improved by the addition of bread and cheese and bacon. In order to convey to them the needful preliminary information, the whole number of colonies might be arranged in districts, to each of which should be appointed a scientific agriculturist, whose duty it would be to visit periodically every farm placed under his superintendence, and to instruct the owner in the principles of husbandry. Such agricultural teachers are already

employed by several landlords, and have in general done much good. When their advice has not been neutralised by superciliousness on their part, it has commonly been very well received. They have easily overcome the prejudices against new practices, entertained by the peasantry, and have persuaded them to adopt improved modes of drainage, better rotations, artificial grasses, and green crops.\* Equal success might be expected with the settlers on the waste lands, and the more surely, as with regard to them, a little compulsion might be used in case of need. The permanence of their tenure might be declared contingent on their behaviour, and they might be threatened with the resumption of their grants unless their farms were brought into cultivation within a specified time.

Such measures, however, would be necessary only with the original colonists, whose vicious habits, inherited from a long line of ancestors, might frustrate any scheme that depended for success on their eradication. But the second and all succeeding generations might be trained betimes in the way in which they should walk. The influence of education might be brought to bear upon them by machinery to be provided in the following manner. The home colonies would either be annexed to villages previously

\* Digest of Evidence, *ut supra*, p. 28.

existing, or would constitute distinct communities ; and on account of the situation of the waste lands, the latter arrangement would probably be by far the most general. To each of the separate colonies should be appointed a schoolmaster, who besides the usual qualifications for the post, should be required to have studied at an agricultural seminary, and thus to have become competent to impart to the children of farmers the special instruction which such pupils require. Every householder should be required by the conditions of his tenure to send his children, between certain ages, to attend the lessons of this master, whose remuneration should consist partly of a fee for every pupil, partly of a rent-free house and grounds, and partly of a rent charge on the land. In a community consisting at first of two hundred families, and occupying consequently sixteen hundred acres, a contribution of eighteen-pence an acre would amount to 120*l.* a year, which, added to the other emoluments of the office, would procure the services of a properly qualified person. The spiritual instruction of the community might be provided for in a similar manner by the appointment of a priest, who, besides a manse and glebe, and the usual ecclesiastical fees, should be allowed a stipend of the same amount as the schoolmaster, and arising from the same source. The rate which it would be necessary to levy for the payment of both religious

and secular teachers, and for the satisfaction of the government claim, would not exceed twelve shillings an acre, or only one-third of the rent that might readily be obtained for the land.

With these precautions, there can be little doubt that the experiment would succeed. The wastes recommended for reclamation are such as would deserve the attention even of a speculator, seeking, not a mere livelihood, but a profitable investment for his money; for experience has shown that an outlay of five or six pounds per acre would add twenty or thirty shillings to the rentable value. Six acres of such land, held at the full rent, enable the Belgian tenant-farmer, not only to live in comfort, but to save money. Eight acres, therefore, held in perpetuity at a rent of only one-third the original yearly value, could not be an inadequate provision even for Irishmen, if only the latter could be induced to work; and it is proposed to urge them to exertion by every motive that can stimulate industry. Perhaps then we may be permitted to assume that the original grantees would rise from their present indigence to comparative affluence. It remains to be considered whether their prosperity would be permanent, or whether it would be frittered away by the gradual subdivision of the original tenements. The question of the inherent tendency of small properties to continual diminution has

already been fully discussed, and it is hoped that sufficient cause has been shown for answering it in the negative. The partition of land, it appears, is seldom carried too far except where the various claimants have, by constant companionship with privation, learned to expect nothing more than a bare subsistence, and have no means of obtaining even that except from the occupation of a piece of ground; and it is probable, that even Irishmen, when relieved from the necessity which now leaves them no alternative but to divide the holdings of their parents, would refrain from a course of which they could not fail to perceive the ruinous consequences. With all their Irishism, they are not altogether void of reason, but would probably act in much the same manner as other rational beings in similar circumstances. If brought up in the enjoyment of competence, they would not content themselves with a miserable pittance, merely because they could derive it from land of their own. If their patrimony were insufficient to maintain them in the style to which they had been accustomed, they would rather dispose of it and seek a livelihood elsewhere. Such are natural inferences from observation of what happens among peasant proprietors in other countries. Still, if attention be confined to Ireland, it cannot be denied that subdivision has long been the universal practice there,—not indeed among

peasant proprietors, for there are none such in the island,—but among the miserable cottars, from whom it is proposed to select the future proprietors. It is possible that, with these men, notwithstanding the change in their situation, habit might be more powerful than prudence, and that the continual subdivision of farms might, in two or three generations, plunge the descendants of the colonists into the destitution from which their forefathers had been raised. Such a result, although very unlikely to occur, is nevertheless possible, and in a matter of so much moment, it would be unwise to leave anything to chance. All ground for apprehension might however be removed—assurance might be made doubly sure,—the possibility of excessive subdivision might be prevented, by the adoption of regulations respecting the succession to the farms to be formed on the waste lands. The construction of such rules would doubtless be a work of great delicacy. In legislating for small estates two opposite evils are to be guarded against—their too frequent consolidation not less than their excessive partition. The former is, indeed, by far the most difficult to prevent, for contiguous properties have so much attraction for each other, that very strong opposing forces are necessary to prevent their union. Small properties have scarcely anywhere stood their ground permanently, except where gavelkind or some

similar custom of inheritance has prevailed ; and if the law of primogeniture should be enforced among the colonists of the Irish waste lands, the class of small proprietors would, doubtless, sooner or later, disappear. But, on the other hand, to establish gavelkind, would be to give a legal warrant for the partition, against which extraordinary precautions are supposed to be necessary in Ireland ; and gavelkind, besides, by ensuring to every child a portion of the family estate, might, perhaps, unduly weaken parental authority. In this dilemma a middle course would perhaps be the most advisable.

When it was proposed to divide the reclaimed wastes into allotments of eight acres, it was not intended to attach any special importance to that size, or to recommend that it should be protected against subsequent alteration. There is, however, a minimum size which properties must possess in order to deserve the name of farms, and a maximum size which they cannot exceed without ceasing to be peasant properties. These limits cannot be defined, for they differ in different situations with the productiveness of the soil, and the skill and industry of the cultivator ; but we will suppose that in Ireland, under good management, five acres would furnish a family with full occupation and plentiful subsistence, and that fifty acres would elevate the owner above the condition of a mere husbandman. If it should be

thought desirable to prescribe these as the most usual boundaries for the possessions of the settlers and their descendants, without, however, absolutely prohibiting the future formation of any of larger or smaller size—the end might be attained by some such rules as the following. An owner of more than five acres might be allowed the power of alienation during his lifetime, provided that he did not dispose of a smaller portion than five acres. A person whose estate did not reach that limit should not be permitted to diminish it, but if desirous of alienating, should be required to alienate the whole. Every land-owner having children might be allowed to select from amongst them one or more to be his heirs, provided that he bequeathed to no one more than fifty acres, without making the same provision for as many of his other children as his estate would permit; and provided also, that he bequeathed to none a portion of less than five acres, unless, after division into portions of five acres, one portion of inferior extent should remain, of which he might then be permitted to make a separate bequest. In the case of persons dying intestate, the eldest son should, if the estate were under five acres, be entitled to the whole, and if it exceeded that limit, should take the principal dwelling-house and five acres adjoining. The remainder of the land might be distributed among the other children, or among as many of

them in order of seniority as could be put in possession of five acres each. If any land then remained, it might, if less than five acres, be given to the eldest of the children previously unprovided for ; and if it exceeded five acres, it should be divided equally among all the children, care being taken in such partitions that every inheritance should be compact, and not composed of scattered fragments. It will no doubt be perceived that a law of succession like this, though professedly designed to prevent the size from falling below five acres, would not only permit, but would favour, the formation of some properties of smaller size. It must also be remarked, however, that it would limit the number of such properties ; and would moreover prevent a property of less than five acres, when once formed, from being again subdivided. With these precautions, the existence of such properties, instead of being an evil, would be attended with the best consequences. If there were no farms too large to be cultivated exclusively by the occupiers, pieces of land too small to furnish their owners with adequate employment and subsistence, might be productive of idleness and poverty, for the deficiency of their resources could not be supplied. But in Ireland there are, and probably always will be, a considerable number of farms extensive enough to require the engagement of hired labour, and upon those

farms, petty proprietors insufficiently employed at home might obtain supplementary occupation. Their pieces of ground would not constitute their principal means of livelihood, but would merely answer the same purpose as the allotments occasionally granted to English labourers, and this the more efficaciously, as they would be held on much more favourable terms. Now the occupation of a little land for cultivation in their intervals of leisure, is not only advantageous to agricultural day-labourers, but seems to be almost indispensable to enable them to live in comfort and security. This they can seldom do when they are entirely dependent upon wages. It seems impossible so to accommodate the supply of agricultural labour to the demand, as that the latter shall be fully satisfied, and yet that labour shall be adequately rewarded. And for this reason. Agriculture requires different quantities of labour at different seasons. If, then, the number of labourers be equal to the demand in the busy season, it must exceed the demand in the slack season. But as even during the first period, competition will have been keen enough to prevent wages from rising above the sum required for the maintenance of a family; at other times it must depress them below that amount, so that the labourer who has no resource but his hire, must be reduced to distress during part of every year. Where day-labourers enjoy competence, it will be found almost invariably

either that they are artisans or manufacturers as well as husbandmen, or that they hold a little land in their own possession. In many parts of the continent they have both these additional resources. In England they have neither. In England, accordingly, when their employers have no immediate occasion for their services, they must apply for eleemosynary aid, and in many rural parishes half the labourers are every winter entered on the list of pauper pensioners. In the settlements to be formed on the Irish wastes, such of the labourers as inherited small plots of ground, would be relieved from this degrading necessity.

Thus, in the colonisation of the waste lands is offered a means of speedily raising the most destitute portion of the Irish people to independence and comfort, and of permanently securing those blessings to their descendants. But the advantages of the scheme would not be confined to those most directly affected by it, but would be shared largely by the remainder of the peasantry, and more or less by every section of the nation. By the removal of nearly two hundred thousand families from the lands already cultivated, an end would be put to the ruinous competition in the land and labour markets; labour would command, and land would be obtainable at reasonable prices; rent would fall to the amount which the farmer could pay without

impoverishing himself, and wages would rise in consequence, both of the decrease in the number of labourers, and of the increase of the means of the farmers. Improvement to this extent would take place naturally and as a necessary consequence of the reclamation of the waste lands, and legislative interference would be requisite only to promote and confirm it. With these views, two suggestions may be offered: one, the enactment of a law rendering the grant of leases obligatory, a measure which, if no longer recommended by the same urgent necessity, would, when tenants were able to negotiate with landlords on more equal terms, be no longer open to the same objection as at present; and the other, the allotment to the labourers remaining on the present cultivated area, of plots of common land, of half an acre or an acre in extent, on the same conditions as the grants made to the settlers on the wastes. The whole body of peasantry—labourers, cottars, and farmers—would then, for the first time, be placed in situations in which their subsequent lot would depend upon their own exertions. Specific instruction might still be necessary to teach them the value of the means at their command, but were this afforded, it cannot be doubted that industry would require no other stimulus than self-interest. Industry would introduce plenty, and plenty be accompanied by content. Tranquillity would suc-

ceed to desperation and violence, and capital would no longer be deterred from flowing wherever a suitable field were offered for its employment. Canals and railways would at once mark and facilitate the progress of enterprise, mines would be worked, fisheries and such manufactures as were adapted to the country established, the conveniences of civilised life would be multiplied and brought within the reach of every class of the community. The advance of national prosperity would correspond with that of individual happiness. The whole empire would receive a vast accession of vigour when its most exhausting drain was converted into an abundant source of wealth, and when the festering wound in one of her principal members was at length healed.

A scheme, so simple, yet promising such brilliant results may perhaps, on that account alone, be summarily rejected as visionary. Large professions are generally received with distrust, the stronger and more natural, in proportion as they are declared to be easy of fulfilment. The condition of Ireland is commonly regarded as almost hopeless; ingenuity has long perplexed itself in attempts to investigate the nature of her disorder; every remedy hitherto applied has failed to afford even partial or temporary relief. It will not, then, be readily believed that the means of effecting a perfect cure were always at hand, open to view, but unnoticed or unappreciated.

Yet, when every other prescription has been tried in vain, a new proposal is at least entitled to examination; and the one offered in the foregoing pages has stronger recommendations than that of mere novelty. Its adoption would procure for the peasantry an extension of territory, which, even if it were not, as it has been shown to be, the only means, would certainly be an infallible means of procuring for them that additional employment, without which they can never emerge from their present debasement. They themselves, with an instinctive perception of what their situation requires, are resolute in their demands for land, and are even now engaged with its actual proprietors in a fearful struggle, of which it is impossible to foresee the end. Yet, to pacify them by assigning additional tracts for their occupation, is not even pretended to be an object of any scheme hitherto propounded, save of this for the reclamation of the waste lands, and of another, already alluded to,—for emigration to British America. The latter, beset as it is with difficulties, apparently insuperable, has nevertheless attracted a considerable share of attention; the very simplicity and practicability of the former are perhaps the cause of its having been treated with comparative neglect. Great statesmen will scarcely deign to listen unless some complicated project—some “great thing”—be submitted for their consideration. They

disdain to use plain and obvious methods for the cure of national leprosy, even as Naaman, the Syrian, hesitated to wash in Jordan and be clean, while there were Abana and Pharpar, rivers of Damascus, better than all the waters of Israel.

## APPENDIX.

---

Letter to the Author from Mr. Le Beir, Secretary of the Royal Agricultural Society of Guernsey, on the Produce of Wheat in that Island.

GUERNSEY, GRAND MOULIN.

13 *January*, 1848.

MY DEAR SIR,

I am glad that our humble islet draws your notice on account of its great productiveness in wheat, and that it has kept a hold on your memory. There is no mistake in the report unless on the part of the grower, and a mistake might certainly sooner occur in grain than in roots, of which a fair average perch out of a vergée is chosen, and seen dug, and weighed by a sub-committee of the general Agricultural Committee. In corn, hitherto, the prizes have been awarded to the best marketable qualities, the extended attention required from the committee, from the cutting to the winnowing of the corn, having deterred them from a further examination; so that it has been more out of curiosity than otherwise, that an account of the produce and a sheaf of the same corn have been required to accompany the bushel sample at the winter show. The largest produce in the last three years has been  $9\frac{1}{2}$ , 10, and 9 English quarters to the English acre, as declared solemnly by the growers, men of the highest respectability, in the

following manner. Suppose ten quarters to the acre ; 500 sheaves per vergée, (I have seen 530), yielding 8 bushels of 44lbs. Guernsey per 100 sheaves, give 10 quarters of 4 bushels Guernsey. Now, as the Guernsey quarter and vergée bear the same proportion to the English quarter and acre, namely, two-fifths, the calculation is easy. In this case it would be 1250 sheaves to the acre, at 352lbs. Guernsey, the 100 sheaves, giving 4400lbs., which, reduced by 55lbs. Guernsey (about the weight of the English bushel), produces 80 English bushels, or 10 quarters. Pure sea-weed ashes, at the rate of 100 bushels an acre, are the best manure. It gives strong straw and heavy grain. The ashes are five-pence a bushel.

Your's most sincerely,

N. LE BEIR.

THE END.

“ We regard the present work as one of the most truly important which has for many years appeared. It is the production of an acute and comprehensive thinker, who speaks not only out of the abundance of the heart, but from the fulness of the understanding, and it possesses a recommendation which belongs to few other treatises on economics—that of being free from the one-sidedness of sectarian views.”—*Morning Chronicle*.

“ A skilful and clever work. Mr. Thornton can select with tact, and present with agreeable clearness, the facts which are necessary to support a view : he can also apply statistics with considerable keenness to establish a foregone conclusion or subordinate argument, and unlike many economical writers, he does not overload his subject.”—*Spectator*.

“ Viewing this work as an inquiry into many circumstances connected with the ‘ Condition-of-England-question,’—particularly as regards the agricultural classes, with suggestions respecting measures now or lately under consideration for their relief, we have found in it much to instruct us, and not a little to praise, even where we are forced to disagree. The book forms a useful addition to the means of information regarding the philosophy of social life, and we therefore recommend it to public notice and favour.”—*Edinburgh Review*.

“ A very able and impartial work by a great free-trade authority, which every member of that house should read.”—*Lord John Manners’ Speech on Factories Bill*.

“ For the accomplishment of these objects I can see nothing so effective as the plan proposed with so much good feeling and good sense by Mr. Thornton, in his admirable work on over-population, to which I venture with confidence to invite the most serious consideration of all who are anxious to fulfil their duties, under the very heavy responsibilities now imposed upon them.”—*Earl of Shrewsbury on Irish Poor Laws*.

## New Works Just Published.
